The results are expressed as % w/w of a dry sample and will not include volatile organic carbons, the majority of which are lost during digestions and drying. The upper range limit of this technique has not been investigated,

while the lower limit is dependent on the sensitivity of the furnace and the sample weight taken. In practice, the LOD is 0.02% of sample weight. The standard used was OAS Acetanilide.

B.6 Hydrocarbons

B.6.1 Extraction Procedures

MMO Methodology

Anhydrous sodium sulphate, sodium chloride and DCM was added to a portion of the as received sample and was vigorously agitated. The sample is placed in an ultrasonic bath and then centrifuged.

Total Hydrocarbon Methodology

A 15g sub-sample of the sample was treated with 15ml of methanol and 60ml of dichloromethane (DCM) and mixed on a magnetic stirring plate for one hour (wet vortex extraction). The solvent extract was then chemically dried, water partitioned and then reduced to approximately 1ml using a Kuderna Danish evaporator with micro Snyder. The clean -up stage utilised 1g of activated silica gel along with DCM and pentane, which removes polar organics. One third of the column was made up with the DCM/Silica slurry and then the column was eluted with 9ml of DCM and 3ml of pentane. The 1ml of DCM extract was then eluted through the column with a further 1ml of DCM and 2ml of Pentane giving a final extract of 4ml (DCM:pentane). The samples were then subjected to a further copper clean up stage to remove any sulphur.

A separate sub-sample was taken for analysis of moisture content by drying at 120ºC for 8 hours. The moisture content was later used to convert the hydrocarbon concentrations from wet weight to dry weight.

B.6.2 Analysis

By UV Fluorescence Screening

An aliquot of the extract was taken and analysed for total hydrocarbons by UV fluorescence screening and quantified by comparing the results against a Forties Oil calibration curve.

By Gas Chromatography

An aliquot of the extract was then taken and analysed for total hydrocarbons and individual n-alkanes by large volume injection GC-FID and one taken to be analysed for PAH, DBT and alkylated isomer concentrations by GC-MS selected ion monitoring as specified in DTI (1992).

Appropriate column and GC conditions were used to provide sufficient chromatographic separation of all analytes and required sensitivity. GC chromatograms are presented in Appendix F.

B.6.3 Quality Control Samples

All samples have surrogates and internal standards (heptamethylnonane (A), 1-chlorooctadecane (B) and squalane (C)) added prior to commencement of extraction. Decanoic acid and eicosanoic Acid were added to the sample post extraction but prior to the clean up stage. These are reverse surrogates to measure the clean up. The method was statistically controlled using both process and instrument quality control samples. Both were sourced independently from the solutions used to calibrate the method. Three instrument blanks of 50:50 pentane:DCM were run initially and one after the continuing calibration check (CCC) before any samples. Two method blanks and an in-house prepared reference material were analysed with each batch and process blank solutions were also run at regular intervals (with each batch) to monitor potential sources of contamination.

APPENDIX B METHODS

B.6.4 Calibration and Calculation

Two calibration check standards are measured by GC-FID before and after each batch. The first CCC is a florida mix used to calibrate the individual alkane method and determine retention times and areas for the nC_{10} – nC_{40} alkane groups. The second CCC is a diesel/mineral oil mix which provides the odd alkane group retention times from nC_{11} – nC_{27}, pristane and phytane. The second CCC is used to calibrate the total petroleum hydrocarbons area.

Concentrations of total hydrocarbons from the extract analysed by GC-FID were quantified by comparison with the chromatographic envelopes from the mixed diesel/mineral oil calibration standards. The concentration in the sample was then calculated against the squalene surrogate. The chromatographically resolved individual n-alkane peaks nC_{10}-nC_{37} were quantified using the florida mix standard.

The GC/MS is calibrated initially at four concentrations to confirm linearity of each target compound across the working range. With each batch a calibration check standard is measured before and after each batch and the concentration calculated from the slope of the four point initial calibration. The CCC is used to calibrate the method and samples are quantified using the CCC response factors.

Concentrations of PAH from the extract analysed by GC-MS were determined by referencing individual quantified mass peak areas for each target compound to the appropriate internal standard quantified mass peak area and the relative response factor calculated from the applicable CCC standard.

The analysis detection limits were 1ng g^{-1} for PAHs, 1ng g^{-1} for individual n-alkanes and 100ng g^{-1} for THC.

B.6.5 PCBs

Approximately 5g of the air-dried and sieved sample was spiked with 13C labelled internal standards, ultrasonically solvent extracted and concentrated under nitrogen. A clean-up stage was employed to remove contaminants that may have interfered with the analysis. The sample extract was analysed by gas chromatography coupled to a triple quadrupole mass spectrometer (GC-MS-MS). Quantification was performed by comparison with a solution containing each of the targeted compounds, normalised to the 13C labelled internal standards.

B.6.6 Organotins

Approximately 5g of the sample was digested with hydrochloric acid and methanol before being extracted into toluene. The extract was then derivatized using sodium tetraethylborate (STEB) before concentration and a copper/silica clean-up was performed. The extract was analysed by GC-MS and quantified by comparing the results against a calibration curve for each of the target analytes.

B.7 Metals

B.7.1 Extractions for ICP-OES and ICP-MS Determination

Aqua regia

Approximately 1g of air-dried and ground (particle size <118µm) sediment was digested for 1 hour with aqua regia. Once cooled the sample was then analysed by inductively coupled plasma- optical emission spectrometry (ICP-OES) or inductively coupled plasma-mass spectrometry (ICP-MS).

APPENDIX B METHODS

Hydrofluoric Acid

Approximately 0.5g of air-dried and ground (particle size <118µm) sediment was accurately weighed and placed in a Teflon digestion vessel. The microwave digestion process involves a two stage extraction process. The digest is made up to 100ml in a Gradplex flask. The sample was then analysed by ICP-OES or ICP-MS.

B.7.2 Inductively Coupled Plasma - Optical Emission Spectrometry (ICP-OES)

Ba was determined using ICP-OES. The spectrophotometer was calibrated using five different concentrations of matrix-matched standards made from dilutions of 10g l^{-1} spectroscopic standard solutions. Detection limits and the spectral line emission wavelengths of the various elements analysed are presented in Table B.9.

B.7.3 Inductively Coupled Plasma – Mass Spectrometry (ICP-MS)

As, Cd, Cr, Cu, Hg, Ni, Pb, V and Zn were determined by ICP-MS. The spectrometer was calibrated using seven different concentrations of matrix-matched standards made from dilutions of 10g l^{-1} spectroscopic standard solutions. Target analyte concentrations were measured by direct comparison to the internal standard with the nearest mass ionisation properties, to take into account changes in plasma conditions as a result of matrix differences between standards and samples. Detection limits and the atomic mass units of the various elements analysed are presented in Table B.9.

Table B.9 ICP Detection Limits, Elemental Emission Wavelengths and Atomic Masses

Analysis	ICP-MS	ICP-OES	HF Extraction LOD (µg g^{-1})	Aqua Regia Extraction (µg g^{-1})
Element	Atomic Mass Units	Elemental Wavelengths (nm)		
As	75		0.14	0.5
Ba		455.403	7.2	
Cd	111		0.03	0.04
Cr	52		1	0.5
Cu	65		0.7	0.5
Hg	202		0.01	0.01
Ni	60		0.4	0.5
Pb	208		0.6	0.5
V	51		1	
Zn	66		3.5	2

B.7.4 Quality Control

Quality control consists of running full method blanks together with one in-house reference material or certified reference material (CRM) where required, and one duplicate sample per batch of twenty samples. Instrument performance is monitored by the use of instrument blanks, continuing calibration checks and independent calibration checks.

Instrument and process blank solutions are also run at regular intervals (with each batch) to monitor potential sources of contamination.

APPENDIX B METHODS

B.8 Metabarcoding

B.8.1 DNA Extraction and Sequencing

Sediment

In the laboratory, DNA was extracted from approximately 10g of each sample for bacterial and infaunal analysis. An extraction blank was also processed for each extraction batch.

Additionally, a further 10g of each sample was extracted for fish DNA analysis with an extraction blank processed for each extraction batch.

Water

DNA was extracted from each filter using a commercial DNA extraction kit with a protocol modified to increase the DNA yields. An extraction blank was also processed for each extraction batch. DNA was then purified to remove PCR inhibitors using a commercial purification kit.

B.8.2 Sequencing

DNA were amplified in triplicate PCRs with primers targeting the V4 region of the 16S rRNA gene for bacteria and the V4-V5 region of the 18S rRNA gene for fauna.

DNA were amplified with PCR for a hypervariable region of the 12S rRNA gene to target fish and vertebrates.

B.8.3 Bioinformatics

Sequence data were processed for quality filtering, OTU clustering and taxonomic assignment. Taxonomic assignments were made for each OTU using sequence similarity searched against two reference databases appropriate for the data set regarding the bacterial and infaunal OTUs. Results for searches were combined and assignments made to the lowest possible taxonomic level where there was consistency. Minimum similarity thresholds of 98%, 95%, and 92% were required for species-, genus-, and higher-level assignments. The OTU table was filtered to remove low abundance OTUs from each sample (<0.05% or <10 reads for bacteria and <0.035% or <10 reads for fauna, whichever is the greater threshold for the sample)

The Fish OTU taxonomic assignments were made against the NCBI nt (GenBank) reference database. Assignments were made to the lowest possible taxonomic level where there was consistency in the matches. Conflicts were flagged and resolved manually. Minimum similarity thresholds of 99%, 97%, and 95% were required for species-, genus-, and higher-level assignments. In cases where there were equally good matches to multiple species, public records from OBIS were used to assess which were most likely to be present in the North Sea. The OTU table was filtered to remove low abundance OTUs from each sample (<3.00% or <10 reads, whichever is the greater threshold for the sample).

B.9 Macrofaunal Analysis

B.9.1 Sorting and Identification

In the laboratory, samples were gently washed across a 0.5mm mesh sieve to remove any sediment fines and preservative. The retained material was sorted by hand to extract all macrofauna. The organisms were identified and counted to produce a species list for each grab sample. Sample residues were checked by a second individual to provide a degree of quality control.

APPENDIX B METHODS

B.9.2 Data Set Rationalisation

The faunal data set was rationalised according to the standard Gardline (2018) procedure, which is largely based on British Standard ISO16665:2005 (BSI, 2005) and OSPAR (2017) guidelines. A summary of these methods follows.

Juveniles

The inclusion of juvenile organisms in data sets is a contentious issue, as is the definition of a juvenile. Only when the following conditions were satisfied was an organism recorded as a juvenile:

- Organisms that were too small or immature to be identified to species were identified to the lowest possible taxonomic level and recorded as juveniles.
- The organism was in a pre-adult life stage *e.g.* megalopa, praniza, *etc.*
- For large-bodied (>4cm) species of echinoderm and bivalve, the organism was less than 10% of the maximum body size reported in the literature.

In accordance with ISO16665:2005 guidelines, juveniles are recorded separately in the faunal list in Appendix H. Juveniles were included in the analysed data set at the lowest achievable taxonomic level. In the first instance, statistical analyses were performed after counts of juveniles of known species had been combined with adult records of that same species. In accordance with OSPAR (2017), if one or more of the juvenile taxa, or species that included juvenile records, were among the ten most dominant, then a RELATE analysis was carried out to compare the data sets with and without juveniles to determine if discussion of both sets separately is required. If the two data sets are found to be at least 95% similar, then the juveniles are included in the data set for all further multivariate analyses and discussion. Alternatively, the multivariate analyses are additionally performed following exclusion of all juvenile records in order to illustrate their influence.

Damaged Specimens

Destructive sampling techniques and sieving may damage delicate benthic organisms. It is, therefore, commonplace for fragmented organisms to be found in faunal samples. The following conditions were applied to the recording of damaged specimens and fragments:

- Fragments that constituted a major component of an individual, that unequivocally represented the presence of an entire organism, and that could be identified to species level, were recorded and included with other counts of that species. Examples include: the heads of polychaetes and crustaceans; the complete mouth structure or central disk of brittle stars; the oral area/feeding tentacles of holothurians.
- Fragments that constituted a significant component of an individual, that unequivocally represented the presence of an entire organism, but that could not be identified to species by virtue of their incompleteness, were recorded to the lowest possible taxonomic level.
- Fragments that did not unequivocally represent the presence of an entire organism were ignored when calculating species abundances, but were included in analyses of biomass, *e.g. Ophiura* arms, *Echinocardium* shell fragments, *etc*.

Treatment of Specific Groups of Organisms

Gardline defines macrofauna as organisms that are normally larger that the mesh size of the sieve used to separate them from the sediment (Gardline, 2018). Meiofaunal organisms, such as Ostracoda and Copepoda, which would not be consistently sampled, were not recorded. Due to their generally small size (in fully marine environments), species from Oligochaeta were only enumerated when a sieve with a mesh size of 0.5mm or less was used to separate organisms from sediments; otherwise, these organisms were noted to be present, but not enumerated.

APPENDIX B METHODS

Due to the large abundance of Nematoda in marine samples these were noted as present but not enumerated.

Planktonic organisms, such as Chaetognatha and Mysidacea were recorded but not included in further analysis. The presence of nektonic species, such as fish, were recorded, and were enumerated.

With the exception of discrete sea pen (Pennatuloidea) colonies, only solitary tunicates and cnidarians were enumerated and included in statistical analyses. Colonial tunicates and cnidarians were identified but not enumerated.

Where Gnathiidae were recorded, those individuals not identified to species level were grouped as a single indeterminate Gnathiidae entry.

In accordance with our in-house guidelines the following organisms were not identified to species, but were enumerated and included in the data set for analyses at a higher taxonomic level:

- Nemertea – identified to phylum
- Platyhelminthes – identified to phylum
- Tardigrada – identified to phylum

B.9.3 Biomass

Following identification of the samples, each individual taxa (where required) were biomassed by wet weight. Biomasses were weighted in grams recorded up to 4dp.

B.10 Statistical Analyses

B.10.1 Hydrocarbon Indices

In order to aid the determination of hydrocarbon sources and levels of weathering of recorded hydrocarbons, a number of indices (largely based on n-alkanes) have been developed (Tran *et al.*, 1995). The following indices were calculated from raw data using Microsoft Excel:

Carbon Preference Index (CPI)
The ratio of odd to even numbered alkanes, commonly referred to as the CPI, may provide further insight into the origin of alkanes in marine sediments. Opinions differ as to which is the most informative chain length over which to calculate CPI. Douglas and Eglinton (1966) suggest that the nC_{20} to nC_{36} range is most informative, whilst Farrington and Tripp (1977) suggest CPI calculated using nC_{27} to nC_{33} alkanes is most informative. The basic premise of most CPI calculations is that land-based vegetation predominantly produces alkanes with odd carbon numbers (*i.e.*, nC_{29}), whereas there is no such tendency in alkanes of anthropogenic or marine origin. Therefore, the sum of odd numbered alkanes divided by the sum of even numbered alkanes decreases with increasing petrogenic contamination. Jeng (2006) indicates that the tendency for land-based vegetation to predominantly produce alkanes with odd carbon numbers is most prevalent in the nC_{27} to nC_{33} range.

The carbon preference index of Farrington and Tripp (1977), which is used more often than any other in the literature, is calculated as follows:

$$CPI = \frac{2(nC_{27} + nC_{29})}{nC_{26} + 2(nC_{28}) + nC_{30}}$$

CPI values close to unity suggest that sediments are contaminated with petrogenic material; whereas values of 4 and above suggest a dominance of biogenic material and a virtual absence of petrogenics.

APPENDIX B METHODS

Pristane/Phytane Ratio

Pristane and phytane are both biogenic and petrogenic but their relative abundance may vary greatly. Pristane is primarily biogenic and most commonly originates from the decomposition of a phytol side-chain of chlorophyll (Muniz *et al.*, 2004). Elevated concentrations of pristane in sediments can be indicative of high levels of microbial degradation. Phytane is rarely produced biogenically but is a common component of crude oil (Steinhauer & Boehm, 1992); it is generally absent or found in only small quantities in marine sediments. Concentrations of pristane and phytane, and their ratio to each other have, therefore, been used as an indicator of petrogenic contamination (Berthou & Friocourt, 1981). In samples that are contaminated by petroleum products the concentrations of pristane and phytane are usually nearly equal (pristane/phytane ratio close to unity) (McDougall, 2000).

Molecular weight PAH Indices

Information regarding the possible petrogenic or pyrogenic sources of PAHs in the environment can be derived from the ratio of PAH compounds of the same molecular weight as detailed by Yunker *et al*., (2002) and adopted by Fisner *et al.,* (2013). Fisner *et al.,* (2013) states that the identification of possible sources can be made according to the ratios that are commonly used in studies related to sediment analysis, such as:

- Ratio of 178 Molecular Weight PAHs (Ant/(Ant+Phe)), where Ant=anthracene, Phe=phenanthrene and values ≤0.10 indicate the dominance of petrogenic sources and >0.10 indicate the dominance of pyrogenic sources;
- Ratio of 202 Molecular Weight PAHs (Fluo/(Fluo+Py)), where Fluo=fluoranthene, Py=pyrene and values ≤0.40 indicate the dominance of petrogenic inputs and >0.40 indicated the dominance of pyrogenic sources;
- Ratio of 228 Molecular Weight PAHs (BaA/(BaA+Ch)) where BaA=benz[a]anthracene, Ch=chrysene and values ≤0.20 indicate the dominance of petrogenic PAHs, >0.20 to ≤0.35 a mixture of inputs and >0.35 the dominance of pyrogenic inputs;
- Ratio of 276 Molecular Weight PAHs (IP/(IP+Bghi)) where IP=indeno[1,2,3-cd]pyrene, Bghi=benzo[g,h,i]perylene and values ≤0.2 indicate the dominance of petrogenic sources and >0.50 indicate the dominance of pyrogenic sources.

B.10.2 Univariate Macrofauna Indices

Univariate community analyses were undertaken using the PRIMER (version 7) software package. Univariate indices seek, by means of a single number, to summarise information about some aspect of community structure. The two aspects of community structure contributing to the concept of diversity are species richness (a measure related to the total number of species present) and evenness (a measure relating to the pattern of distribution of individuals among the species present).

Diversity indices, as typified by the Shannon-Wiener index, are considered to be a relatively insensitive measure of anthropogenic disturbance. However, benthic ecologists have been able to demonstrate a clear inverse relationship between diversity and total oil concentrations in sediments (Davies *et al.*, 1984). They are therefore of some practical use for making comparisons between stations and sites.

The following indices were calculated and are presented in the report:

Margalef's Richness Index

Species richness is sometimes given simply as the number of species in a sample but this is of course very dependent upon sample size. Alternatively, Margalef's index (*d*) may be used as this takes account of the number of species present for a given number of individuals. Margalef's richness index is calculated as follows:

APPENDIX B METHODS

$$d = \frac{(S-1)}{\ln N}$$

where d = Margalef's richness
S = total number of species
N = total number of individuals

Shannon-Wiener Diversity Index

This is a widely used measure of diversity providing an integrated index of species richness and relative abundance (Clarke & Warwick, 2006). It is basically a measure of the difficulty of predicting the identity of an individual based on overall community composition. The Shannon-Wiener diversity index is expressed as:

$$H' = -\sum_{i=1}^{s} p_i \log_n p_i$$

where H'= Shannon-Wiener diversity index
p_i = proportion of the total number of individuals from the ith species.
n = log base value (log base 2 is used during this report; Shannon & Weaver, 1949)

H' integrates the number of species and individual abundance to provide a summary value reflecting the diversity of fauna at a station. This index of diversity is influenced by both species richness (*i.e.* the number of species) and evenness (or equitability) of distribution of individuals between species.

Simpson's Dominance Index

Simpson's is a dominance index derived from the probability of picking two individuals from a community at random that are from the same species. Therefore Simpson's dominance index values with be large when a community is dominated by one or a few species but lower when the community is diverse. Simpson's dominance index was calculated as follows:

$$\lambda = \sum {p_i}^2$$

where λ = Simpson's dominance index
p_i = proportion of the total number of individuals from the ith species

Simpson's dominance index ranges from 0 to 1 with values typically reflecting the abundances of the most common species in the samples.

Pielou's Evenness

Evenness (or equitability) is a representation of how uniformly individuals are spread between species in a sample. It is a component of, and calculated using, a theoretical diversity measure (in this instance Shannon-Wiener). Values range from 0 to 1 with high values indicating low dominance and high evenness (*N.B.* the log base that was used to calculate H' must also be used to calculate evenness).

$$J = \frac{H'}{\log_n S}$$

where J= Pielou's evenness
H'= Shannon-Wiener diversity index
S= total number of species in a sample

APPENDIX B METHODS

Rarefraction

Rarefraction calculates the species richness for a given number of individual samples based on the construction of rarefraction curves.

$$fn = E[Xn] = K - \left(\frac{N}{n}\right)^{-1} \sum_{i=1}^{K} \left(\frac{N - N_i}{n}\right)$$

where N = total number of items
K = total number of groups
N_i = the number of items in group i
X_n = the number of groups still present in the subsample of "n" items

Species Accumulation Curves

Species accumulation curves show the increasing total number of different taxa observed as samples are successively pooled. Two versions are plotted in this report; the first (plotted in blue) simply takes the samples in their label order, this is often referred to as the "species observed" (Sobs) curve. The second curve (plotted in red) is smooth as it is an averaged output based on the samples being added in random order 999 times. This is referred to as the UGE (Ugland, Gray, Ellingsen) curve after Ugland *et al.*, (2003).

Species Ranking

A measure of the overall dominance pattern in the sampling area may be achieved by ranking the top species per station according to abundance, giving a rank score of ten to the most abundant species, decreasing to one for the tenth most abundant species, and summing these scores for all stations to provide an overall dominance score for each species (Eleftheriou & Basford, 1989). For those species ranked in the top ten, the fidelity of the species ranking can be assessed by comparing the actual rank score with the maximum possible score (thus ten multiplied by number of stations for the top rank, etc.) for that rank as a proportion; perfect fidelity is equal to one; values lower than 0.8 or higher than 1.2 represent erratic ranking, as in a species with a patchy distribution.

B.10.3 Multivariate Analyses

In addition to univariate analyses, the data were subjected to multivariate analysis using a number of different methods available within the PRIMER package (Clarke & Warwick, 2006). By considering the full data matrix as a whole and comparing each station with every other, multivariate analyses can highlight subtle trends in data sets that are commonly not identified when using univariate techniques. Multivariate techniques are not restricted to use with faunal data sets and if treated appropriately may also be used to compare complex physico-chemical data sets. Multivariate analyses were computed from resemblance or similarity matrices. In the case of faunal abundance data these were constructed using the Bray-Curtis measure of similarity following transformation of the data to down-weight the influence of highly abundant or dominant species. For the purposes of this survey, a fourth-root transformation was utilised due to the high variability of individual species abundances across the survey area. According to Clarke and Warwick (2006), square root transformation allows the intermediately abundant species to contribute to the similarity, while a fourth root takes account of the rarer species. Note that there is rarely any practical difference between fourth root and log transformation for cluster and ordination results of faunal data, although the former is more reliable (use presence/absence rather than log). Chemical data resemblance matrices are computed using Euclidean Distance following transformation (where necessary) and normalisation to standardise measurement scales. Additionally, DNA resemblance matrices are computed using Euclidean Distance following standardisation.

Cluster Analysis and SIMPROF

Cluster analysis groups samples according to their similarity *i.e.*, samples within a group are more like each other than they are to samples in other groups. Clustering was by a hierarchical agglomerative method using group average sorting, and the results are presented as a dendrogram. Using PRIMER v7 it is possible to

APPENDIX B METHODS

perform a SIMPROF (similarity profile) test at the same time as the cluster analysis to determine whether groups of samples are statistically indistinguishable or whether they contain identifiable structure. SIMPROF is an *a priori* test designed to identify groups of samples from unstructured data sets. The test employs a permutation-based analysis to determine whether groups of samples below each successive node of a dendrogram possess identifiable internal structure. If the result of a test at a particular node is not significant there is no identifiable structure within the samples below the node and they might therefore be a uniform group. A significant result indicates that samples within a group (below a particular node in the dendrogram) contain some structure and therefore may not be considered uniform. The analysis therefore identifies groups of samples that are each highly self-similar and also that are distinguishable from each other.

Ordination Analyses using non-Metric Multidimensional Scaling

Non-metric multidimensional scaling (nMDS or MDS) is a type of ordination method which creates a 2- or 3-dimensional 'map' of the samples (or stations) from the similarity matrix. The configuration of the samples on the 'map' is a reflection of their similarity, with distances between samples being representative of their dissimilarity.

It is normal for there to be some distortion (stress) between actual similarity values (in the resemblance matrix) and distance between samples on the ordination plot; perfect solutions are very rarely achieved when dealing with complex data sets. In order to achieve the lowest possible stress PRIMER adopts an iterative approach to ordination, constructing the plot by successively refining the positions of samples until the lowest stress is achieved. In reality the lowest possible stress is not always achieved since data points may become trapped in local minima. It is therefore necessary to re-run the analyses multiple times to ensure that the lowest achievable stress is found. The ordination analysis results reported were the product of a minimum of 25 restarts. In instances where the lowest achieved stress was found for <5 (20%) of the restarts the ordination was repeated with 999 restarts to ensure that a lower stress result could not be found.

The scale and orientation of MDS ordinations are arbitrary so no axes are drawn on the plots. Stress values increase with sample size, and usually also with increasingly severe transformation of the initial data set (due to the increasing influence of rarer species on the outcome of analyses). The stress value may be used as an indication of the usefulness of plots, with a general guide being as follows (Clarke & Warwick, 2006):

<0.05	Almost perfect representation of rank similarities
0.05 to <0.1	Good representation
0.1 to <0.2	Still useful
0.2 to <0.3	Should be treated with caution
>0.3	Little better than random points

BEST (BVSTEP)

Where differences in macrofaunal community structure are found it is acceptable to attempt to link these to abiotic variations in the environment. This may be achieved using multivariate routines in the PRIMER called BVSTEP and BIOENV. In this instance BVSTEP analysis has been used due to the large size of the data sets.

BVSTEP uses a stepwise procedure to search amongst a specified data matrix (normally the transformed and/or normalised data matrix) to find subsets of variables (or species) that best 'fit' the multivariate pattern of a separately specified resemblance matrix. In other words it identifies a subset (or subsets) of variables within one data set that produces the most similar (highest correlation) pattern to the overall multivariate pattern of another data set. From a random starting point the analysis adds and removes variables from the initial data set and assesses whether these improve or worsen the match to the second data set overall. Once the best match is achieved analysis is terminated. The result depends somewhat upon the starting point of the analysis and the test is therefore always used with multiple restarts in order to ensure that that the best fit is found.

APPENDIX B METHODS

Since BVSTEP may be used to compare any two similarly structured data sets it has a variety of applications. These include Bio-Env tests (where the subset of environmental variables that best fit or 'explain' the biotic data are determined), Env-Bio tests (where the subset of species that best fit the environmental data are determined) and Bio-Bio tests (where a subset or subsets of species that most resemble the overall multivariate biotic pattern are determined). The results of these analyses may provide valuable insight into the processes affecting species distributions in survey areas.

ANOSIM

ANOSIM is a multivariate equivalent of an ANOVA test. It is applied to a priori structured data sets to test for differences between pre-selected groups of samples or stations. For instance, ANOSIM may be used to test whether the fauna found <1km of an offshore installation differs from that found at >1km. The result of such an analysis might provide an indication of whether the installation and operation of offshore facilities has affected the benthic community. Results of ANOSIM tests are given as r values that range from 0 (no difference) to 1 (highly different), and the significance is determined by comparison to the randomly permuted distribution of the samples included in the analysis.

SIMPER

Where differences between groups of samples are found, SIMPER may be used to interpret which species, or environmental variables, are principally responsible for the differences between the groups and which are most responsible for the similarities within groups. The SIMPER analysis decomposes differences between all pairs of sample, one from each identified group, into their contributions from each species or variable, and ranks them in decreasing order of their contribution to overall dissimilarity.

RELATE

The RELATE test of PRIMER calculates the rank similarity of two specified data matrices, so, for instance, may be used to provide an indication of the effect of the removal of a subset of taxa (*e.g.*, juveniles) on the structure of the data set overall.

B.10.4 Spearman's Rank Correlation

Spearman's Rank Correlation Co-efficient is a non-parametric correlation analysis that may be used to test for relationships between environmental variables. Significant relationships indicate that environmental variables vary similarly. Large numbers of significant correlations might suggest the presence of an environmental gradient, that in the absence of obvious natural changes in the environment (such a depth gradient), may be attributable to point source pollution or some other form of anthropogenic interference. A matrix of Spearman's rank correlation coefficients, comparing many of the environmental variables, was calculated using Microsoft Excel and is presented in Appendix E.

B.10.5 Grubb's test for Outliers

Within the data set of environmental variables, one or more values may differ considerably from most of the rest. To identify such values for investigation as to whether they are deviant results or indicative of a notable trend at seabed, Grubb's test may be used for data sets containing >25 samples and assumes a normal distribution.

The Grubb's test (also called the extreme studentised deviate) compares each value with the mean and the standard deviation for that variable.

The results of the Grubb's test for both high and low outliers was calculated using Microsoft Excel and is presented in Appendix E.

APPENDIX B METHODS

B.11 EUNIS Habitat Classification

Habitat classification is used to identify different habitats and biotopes based on the biotic and abiotic features of the seabed. Habitat and biotope classifications were conducted on the available survey data, adhering to protocols within the European Union Nature Identification System (EUNIS). The system was developed between 1996 and 2001 by the European Environment Agency (EEA) in collaboration with European experts. The table below gives examples of the five EUNIS levels used to describe the marine environments.

Table B.10 Example EUNIS Habitat Classification Levels

	Detail Covered (EUNIS code)
1. Environment	Marine benthic habitats (M)
2. Broad habitats	Circalittoral biogenic habtiat (MC2)
3. Main habitats	Atlantic circalittoral biogenic habitat (MC22)
4. Biotope complexes	Worm reefs in the Atlantic circalittoral zone (MC221)
5. Biotopes	*Sabellaria spinulosa* on stable Atlantic circalittoral mixed sediment (MC2211)

Development of the EUNIS classification comes from both a top-down and a bottom-up approach. The first division is based on differentiating between major biological zones related to depth (littoral down to abyssal) and differentiation of substrate type *(e.g*. rock, sand, gravel). These high-level divisions can be further subdivided based on the main biogeographical regions of Europe's seas (*e.g*. Arctic, Baltic, Atlantic) with these regional splits being based on a combination of salinity and temperature. Such broad-scale differences in habitat character are readily understood by non-specialists and provide classification types that are easily mapped. However, they also have ecological relevance as they reflect major changes in habitat character upon which species distribution depends (Connor *et al.*, 2004).

Bottom-up classification differentiates between places with different species communities. Relative species composition, diversity and abundance vary from place to place and are dependent both on environmental characteristics and upon interactions between species. Surveyed sites with similar environmental characteristics, such as sediment type and depth, show certain levels of similarity in their species communities.

APPENDIX C BACKGROUND INFORMATION

APPENDIX C BACKGROUND INFORMATION

C.1 Sediment Characteristics

Particle size distributions of sediments in the marine environment are to a large extent determined by hydrodynamic energy at the sediment water interface. Strong currents tend to scour the seabed thereby resuspending fine particles and any material associated with them, whilst the finest sediments predominate in areas with the least hydrodynamic energy.

The role of sediment in the transport and retention of chemical pollutants is tied to both particle size and to the amount of particulate organic carbon associated with the sediment. The chemically active fraction of sediment is usually cited as the organic component and the finest size fractions (smaller than 63µm, silt, clay). The sediment, in particular the organic carbon and finer fractions, acts as a sink for many of the persistent compounds, including metals, hydrocarbons and chlorinated compounds. Many of these persistent substances are also inherently bioaccumulative and toxic. The concentrations of many parameters are typically positively correlated with the proportion of fines found in the sediment as a result of fine particles possessing a relatively large surface area. Fine sediment particles are relatively easily resuspended by waves and currents, and may be transported, along with the materials sorbed to them, over large distances, finally being deposited in areas of lower hydrodynamic energy.

Generally speaking, sands and coarser grained materials are often organically deficient. Strong currents have a tendency to resuspend fine materials and their associated organic matter. Therefore, in an environment that is not nutrient enriched due to anthropogenic discharges, both total organic matter and total organic carbon will normally be lowest at sites with coarse-grained sediment, where currents are often strongest.

Sediment particle size and organic content are also critical measurements for the categorisation of habitat type since to a large extent they control which organisms are capable of living within sediments. Most benthic infaunal organisms exhibit preferences for sediment with particular grain size characteristics. Many organisms live in tubes or burrows constructed from sediment particles; each organism's ability to do this may be limited by the range of different sized particles available. The distribution and abundance of free-living mobile organisms, *i.e.*, those that do not construct tubes or burrows, are also affected by particle sizes, which influence their ability to move within the sediment. Sand grains of inappropriate sizes may be too big to move or, conversely, too small to be stable.

Feeding guilds are groupings of organisms based upon the feeding strategies they employ (US EPA, 2008) and, as such, sediment particle size and organic content can greatly affect which species guilds may dominate in any given area. Many deposit feeding organisms, which process sediment through the alimentary tract to obtain nutrition (Gage & Tyler, 1992), are highly selective of the grain sizes that they will ingest, often preferring finer sediments that possess relatively high organic content. Conversely, resuspension of fine particulate matter may clog delicate filtering apparatus used by suspension feeders to obtain their suspended food particles from seawater (Gibson *et al.*, 2005), resulting in their exclusion from muddy sediments. Additionally, the mixtures of particle sizes determine the ease with which water and oxygen move through the sediment. An abundance of fine particles in a stable environment may lead to the formation of substrata with small interstitial spaces through which oxygen diffusion can be restricted. This may lead to anoxic conditions within the sediment, which further affects the range of species that may be present. Determination of sediment particle sizes and organic content is therefore of critical importance to the interpretation of benthic environmental survey data.

APPENDIX C BACKGROUND INFORMATION

C.2 Sediment Hydrocarbons

The principal sources of hydrocarbons in the marine environment are anthropogenic (McDougall, 2000). However, contamination of the marine environment with crude oils is not a recent phenomenon, nor solely attributable to anthropogenic activities (Douglas *et al.*, 1981). Three general processes can add hydrocarbons to marine environments: biosynthetic, geochemical and anthropogenic (McDougall, 2000).

Oil is a complex mixture of hydrocarbons and other organic compounds. Hydrocarbons are the principal component of oil, usually contributing >75% of the constituents (Laflamme & Hites, 1978). Petroleum hydrocarbons can be divided into the following broad classes according to their structure: saturates (alkanes, isoalkanes and cycloalkanes), olefins (alkenes), aromatics (benzene, toluene, ethylbenzene and xylenes, or BTEX, and polycyclic aromatic hydrocarbons), asphaltenes, polar compounds and resins (Leahy & Colwell, 1990; Wang & Fingas, 2005).

Due to the complex and variable composition of oil in marine sediments, quantification of total hydrocarbons, groups of hydrocarbons and individual hydrocarbons is required to allow identification of the source of oil within the sediments, be it anthropogenic, biogenic or geochemical. The Department of Energy and Climate Change (DECC, formerly BERR and DTI) guidelines (DTI, 1992) call for the following analyses to be conducted for environmental surveys (including baseline surveys): THC concentration, UCM concentration, individual and total n-alkane concentrations, pristane and phytane concentrations; individual and total 2-6 ring PAH concentrations, and those of their respective alkyl derivatives (DTI, 1992).

Total Hydrocarbon Concentration

THC concentration gives an indication of the total hydrocarbon present within a sediment sample; it does not give an indication of the source of contamination. The definition of THC is wholly dependent on the analytical process utilised to quantify it. In this case, THC is equivalent to total n-alkane (nC_{10} to nC_{37}), pristane, phytane, UCM and total PAH (all PAHs including alkylated derivatives) concentrations.

Unresolved Complex Mixture

The UCM consists of a large variety of branched alicyclic hydrocarbons, which are not resolved by conventional capillary gas chromatography (GC) columns and appear as a 'hump' in GC chromatograms (Bouloubassi *et al.*, 2001). These compounds remain after substantial weathering and biodegradation of petrogenic inputs has taken place, with the 'hump' becoming a more predominant feature as resolvable n-alkanes are selectively transformed by weathering. Abundant UCM is ascribed to either degraded or weathered oil residues, and therefore its occurrence in environmental samples is an indicator of oil pollution (Bouloubassi *et al.*, 2001). Notably, a UCM between nC_{20} and nC_{34}, centred on nC_{29} is typical of North Sea sediments, and is generally considered as 'North Sea Background'.

N-alkanes

Alkanes are the simplest aliphatic compounds, containing only carbon and hydrogen held together by single bonds and not containing a ring; they have the general formula C_nH_{2n+2} (Lyons & Plisga, 2005). The n-alkanes are continuous, straight chain alkanes, while branched-chain alkanes are known as isoalkanes or isoprenoids (Lyons & Plisga, 2005). The only isoprenoids quantified in this survey are pristane and phytane, which are isomers of nC_{18} and nC_{19}. These compounds are substantially less susceptible to weathering than their straight chain equivalents and are therefore of use when investigating the degree of weathering of a sample (Tran *et al.*, 1995).

APPENDIX C BACKGROUND INFORMATION

Although generally less harmful to many living organisms than aromatic hydrocarbons, analysis of the aliphatic component (n-alkanes, pristane and phytane) can still provide valuable information to aid in the determination of hydrocarbon sources (Tran *et al.*, 1995). N-alkanes can be derived from a variety of origins, both anthropogenic and natural; it is therefore necessary to distinguish which of these are present, or indeed predominate, in a given environment (Tran *et al.*, 1995). There is a wide range of methods available for this purpose, but those undertaken in this report include: quantification of individual n-alkane concentrations, interpretation of GC chromatograms, the CPI (Farrington & Tripp, 1977) and the pristane:phytane ratio (Berthou & Friocourt, 1981).

Polycyclic Aromatic Hydrocarbons

PAHs and their alkyl derivatives are almost ubiquitous in marine environments (Laflamme & Hites, 1978). Natural sources of PAHs include forest fires (Youngblood & Blumer, 1975), synthesis by plants (Neff, 1979) and oil seeps (Page *et al.*, 1998). However, the largest sources of PAHs are associated with anthropogenic activities, particularly fossil fuel combustion (Neff, 2004; Laflamme & Hites, 1978). Pyrogenic PAHs may be transported long distances through the atmosphere before finally being deposited. Even after deposition, PAHs may undergo further transport, *e.g.* in urban runoff and rivers, before ultimately being deposited in marine sediments, where they sorb to organic matter and sediment particles.

Concentrations of PAHs in marine sediments vary by many orders of magnitude, ranging from less than 1ng g^{-1} in deep-water oceanic sediments up to a few mg g^{-1} in highly contaminated harbours and coastal sediments (Neff, 2004). In enclosed waters subjected to oil exploration and production activity, PAH concentrations tend to be somewhat higher than in the open ocean. Generally speaking, the greatest PAH concentrations are found in coastal sediments. Barring the presence of point sources of hydrocarbon contamination, total PAH concentrations in marine sediments normally decrease with distance from major human population centres (Larsen *et al.*, 1986).

The occurrence and concentration of PAHs in the environment is of concern since many possess mutagenic, carcinogenic and toxic properties (McDougall, 2000; Neff, 2004). Many PAHs are readily bioaccumulated through the food web and higher weight aromatics in particular are persistent. The rate at which PAHs degrade is affected by many factors; in the marine environment photooxidation and biodegradation are considered to be the two most important processes of degradation (Neff, 2004). Therefore, PAHs are likely to be most persistent in cold, high latitude deep-waters where sediments receive little or no light. ESGOSS (1994) estimate the half-lives of 2-ring aromatics to be generally less than 100 days whilst heavier weight 5- and 6-ring aromatics may possess half lives in excess of 10,000 days.

Although found in most marine sediments, petrogenic aromatics are normally less abundant than the pyrogenic, HMW aromatics (Bence *et al.*, 1996). Elevated concentrations of LMW, more volatile, 2 and 3 ring PAHs (NPD) may often be related to the presence of point sources of hydrocarbon input, including oil spills, natural seeps, drilling activity and produced water outfalls (Neff, 2004). A major source of NPD PAHs is the use of oil-based muds during drilling operations and the subsequent discharge of these cuttings on the seabed (Breuer *et al.*, 2004). Pyrogenic PAHs tend to be more widespread, but generally in relatively low concentrations.

The concentrations at which individual PAHs produce toxic effects vary widely (Long *et al.*, 1995) and are dependent on their type and bioavailability. Values for the toxicity of individual aromatics may be misleading since individual PAHs are rarely found in isolation. The best estimates of the potential toxicity of PAHs in marine sediments are ERL and ERM concentrations for total LMW, total HMW and total PAHs (Neff, 2004). Long *et al.* (1995) gives ERL concentrations for LMW and HMW PAHs of 0.55 and 1.70µg g^{-1}, respectively. ERM concentrations are 3.16 and 9.60µg g^{-1} for LMW and HMW PAHs, respectively. The ERL and ERM concentrations for total PAH concentration in sediments are 4.022 and 44.792µg g^{-1}, respectively. These

APPENDIX C BACKGROUND INFORMATION

concentrations are not actual thresholds of toxicity, but delineate concentration ranges with associated probabilities of toxicity. The ERL is the tenth percentile in the PAH effects data provided by Long *et al.* (1995), while the ERM is the median, or 50th percentile. Concentrations below the ERL concentration therefore represent a range in which effects would rarely be observed; concentrations equal to or above the ERL concentration, but below the ERM concentration, represent a range in which effects would occasionally occur and concentrations equalling or exceeding the ERM concentration represent a range within which effects could frequently be expected.

The US EPA identified 16 priority low and higher molecular weight PAHs. Nine of these were selected by OSPAR as the focus for their studies and are the 4 to 6 ring compounds of particular importance due to their toxic nature even at very low concentrations. OSPAR CEMP EAC benchmark concentrations (OSPAR, 2009b) have been developed for the nine OSPAR priority PAHs plus naphthalene and dibenzothiophenes (DBT).

Information on the source of PAHs in sediments may be obtained from a study of the alkyl homologues (*e.g.* methyl, ethyl etc. substitution) and parent compound distributions and concentrations. Sediments contaminated with petrogenic material normally contain a predominance of alkylated PAHs, particularly within the LMW range, whereas pyrogenic PAHs comprise mostly HMW unalkylated parent compounds.

C.3 Sediment Metal Concentrations

Metals are generally persistent and at elevated concentrations most are toxic to varying degrees. Many metals such as copper, zinc and chromium are readily bioaccumulated meaning that they are absorbed and stored in organisms over time leading to potential high concentrations capable of causing lethal and sub-lethal toxic effects in benthic organisms even when found in apparently low concentrations in sediment. Metal concentrations in uncontaminated marine sediments generally exceed those found in overlying seawater by three to five orders of magnitude (Bryan & Langston, 1992), since the buffering effects of saline water cause many metals to be rapidly precipitated. Furthermore, dissolved metals are readily scavenged from the water column by organic coatings and iron and manganese coatings found on the surface of fine sediment particles. Consequently fresh waters that are metal enriched by terrestrial runoff tend to deposit much of their metal load in estuarine or near coastal sediments. Ecological impacts attributable to anthropogenic metal contamination in non-coastal marine environments are often somewhat limited in geographical range close to the point of their origin (Rygg, 1985).

Several metals are found in high concentrations in drilling muds and produced water. Some of these metals are added intentionally to drilling muds as metal salts or organo-metallic compounds whilst others are present as trace impurities in major mud ingredients, particularly barite and clay. Those metals most characteristic of contamination of the sediment with drilling muds or cuttings are barium, chromium, lead and zinc (Neff, 2005), but this may vary depending upon the specific constituents of the muds. By far the most abundant metal in most drilling muds is barium, found in the form of barite ($BaSO_4$). In exceptional cases, fine-grained marine sediments may naturally contain in excess of 1000µg g^{-1} barium, but this figure may be greatly enhanced by contamination of sediments with drilling muds containing up to 450mg g^{-1} barium (Neff, 2005). Due to its low solubility and the fact that it is not toxic in its sulphate form (Gerrard *et al.*, 1999), elevated barium concentrations are rarely of toxicological concern. However, monitoring sediment barium concentrations can provide information regarding the extent to which drill cuttings have been transported from their point of origin.

When considering the results of the sediment metal determinations it should be borne in mind that speciation (the particular forms, or species, of any given metal that exist in a sample), sediment granulometry and partitioning of metals between water and sediment phases all affect bioavailability and therefore toxicity. Even if

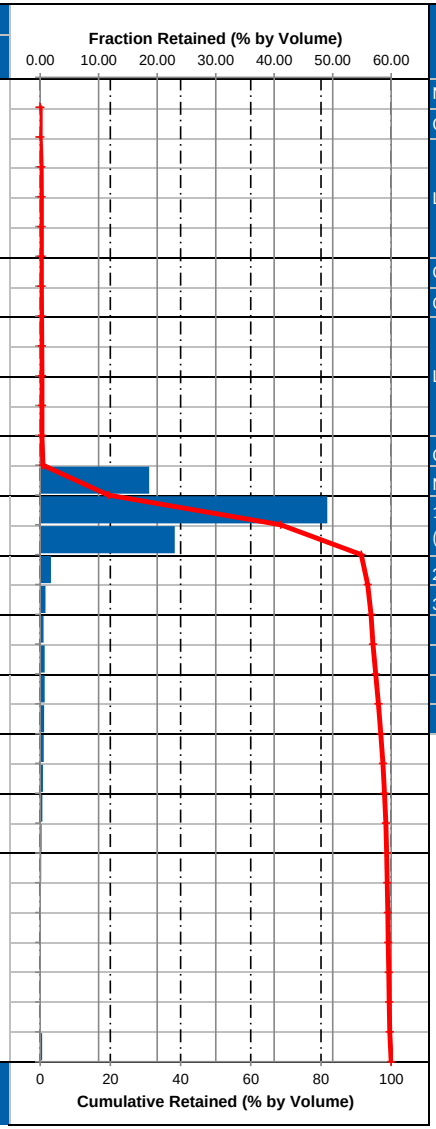
APPENDIX C BACKGROUND INFORMATION

a metal is present at above normal concentrations, it does not necessarily follow that the metal will produce ecologically deleterious effects, particularly if it is present in an insoluble or relatively low toxicity form. Historically, a wide range of different extraction techniques have been employed that were intended to provide an estimate of the concentrations of metals in marine sediments that may be available to the biota. One of the most commonly used methods of modelling metal bioavailability is extraction of oxic (surficial) sediments with weak acids (*e.g.* 1M nitric acid) since most anthropogenic metal contaminants show a much higher affinity to fine particulate matter than the coarse fraction by the presence of organic matter and clay minerals. These techniques have been shown to produce results that correlate closely with metal burdens in the tissues of benthic organisms (Luoma & Davis, 1983; Bryan & Langston, 1992). However, the extent to which a particular method of extracting metals from sediments reflects their bioavailability is still not well understood, and the debate regarding which methods may be most appropriate is ongoing.

Total sediment metal concentrations have historically been the preferred measurement for offshore surveys. Whilst these provide little information regarding concentrations of metals that may be bioavailable, since they involve total dissolution of the sediment, they are; however, useful for comparisons between surveys and will give an indication of whether or not sediments are contaminated. There is a growing body of data that provides broad figures for the total concentrations of many metals likely to be found in uncontaminated marine sediments (see OSPAR, 2005). Baseline figures may therefore be compared to these data in order to assess whether sediments in an area may have been anthropogenically contaminated prior to any works being carried out. Where elevated concentrations of metals are found, results may be compared to existing sediment metal toxicity data in order to assess whether particular metals may be exerting a toxicological effect on benthic communities (see Buchman, 2008).

C.4 Macrofaunal Analyses

The macrofaunal investigation in this survey is designed to provide a description of the benthic infauna and how it varies across the survey area. Marine benthic invertebrate communities have been shown to be sensitive to environmental change, particularly environmental degradation as a result of anthropogenic contamination (Davies *et al.*, 1984; Warwick & Clarke, 1991). Analysis of faunal data sets may therefore provide insight into any changes resulting from point source pollutants and disturbance.



C.5 Sediment Metabarcoding

In addition to traditional methods used for sediment metabarcoding in this survey sediment metabarcoding acts to increase assessments of important components of biodiversity that may be neglected due to the difficulty of taxonomic identification using conventional morphological approaches. DNA biodiversity monitoring provides additional information about the sediment biodiversity of the bacteria and fauna within the survey area. Bacteria are a useful indicator of water quality due to species diversity and ability to respond to changing environmental conditions (Lemke *et al.*, 1997).

EXECUTIVE SUMMARY

During June to November 2023, Gardline Limited conducted an integrated survey on behalf of Morven Offshore Wind Limited along the export cable routes (ECRs) of the proposed Morven wind farm, situated approximately 60km southeast of Aberdeen. The survey was conducted onboard the motor vessel *Ocean Geograph* between 19-Jun-2023 and 10-Nov-2023 with the environmental operations undertaken between 04-Jul-2023 and 09-Nov-2023. The current report details the results of the habitat assessment with the results of the geotechnical survey and the environmental baseline survey summarised where relevant and are reported in full separately (Gardline, 2024a; Gardline, 2024c).

The aims of the environmental survey were data collection to support the design of an ECR connecting the proposed Morven wind farm to shore, as well as to determine characteristics of the seabed and benthic communities and to identify any environmentally significant habitats.

A total of 133 stations were pre-selected as part of a benthic survey strategy desktop study of publicly available data prior to survey acquisition (Gardline, 2023). This comprised 56 stations (Stations ENV001 to ENV056) located along the eastern route, 58 stations (Stations ENV071 to ENV128) located along the western route and 19 stations (Stations ENV057 to ENV070 and Stations ENV129 to ENV133) situated across options for landfall. At all 133 stations drop-down camera data were successfully acquired. Sediment sampling was conducted at 133 stations across the survey area, of these the required full suite as per the benthic scoping document (Gardline, 2023) was obtained at 127 stations. All successful samples were acquired using a 0.1m^2 Day grab. Grab samples were acquired every 4km and alternated between three and four samples. Water depth varied between 16m LAT in the nearshore southwestern and 106m LAT across the survey area.

The visible faunal community observed across the survey area was typically sparse with 46% of images containing no visible fauna. Where observed, fauna was characterised by burrows, *Pennatula phosphorea* and faunal turf.

Overall, two species of sea pen (*P. phosphorea* and *Virgularia*) were identified at 84 stations ranging between 0.2cm and 11.4cm and 1cm and 15.3cm respectively, whilst burrows were observed at 73 stations ranging from 0.5cm to 14.9cm. In accordance with the SACFOR classification scale, burrows were classified in a range that encompassed ‘frequent’ at 46 stations. Considering the survey area as a whole, both burrows and sea pens were classified within a range that encompassed ‘frequent’; therefore, the survey area shows some similarity to a ’sea pen and burrowing megafauna communities’ habitat which is on the OSPAR (2008) list of threatened and/or declining species and habitats. This habitat is also listed as a component biotope of the burrowed mud habitat which is a priority marine feature (PMF; NatureScot, 2020). However, burrowing fauna were rarely sighted (only 37 individuals of *Nephrops norvegicus* were observed across the whole survey area); therefore, burrows could not confidently be attributed to any of the classified ‘megafauna’ species within the ‘sea pen and burrowing megafauna communities’ habitat classification. Although this habitat is on the OSPAR (2008) list of threatened and/or declining species or habitats, it is widespread throughout the central North Sea, around the southwest and west coasts of Norway and around the north of the British Isles (OSPAR, 2010; Hill *et al.*, 2022).

Areas of cobbles and boulders were noted during analysis. As such stations were reviewed for their potential to form a stony reef habitat based on the criteria adopted by Irving (2009). Stations ENV020, ENV032, ENV035, ENV038, ENV050, ENV051, ENV052, ENV67b, ENV068, ENV069, ENV070, ENV073, ENV103, ENV105, ENV106 and ENV132a were matrix supported, with little relief overall and often comprised small patchy extents across larger swathes of gravel. None of these stations were classified as having any resemblance to rocky reef.

Station ENV092 recorded sandy gravel which presented the greatest herring spawning potential as this met the 'prime' habitat sediment preference as set out by Reach *et al.* (2013). Station ENV076 recorded gravelly sand which was classified as 'sub-prime' in terms of habitat sediment preference. All remaining stations were deemed unsuitable for herring spawning potential.

Sand eels (Ammodytidae) were observed at one station (Station ENV043) in seabed imagery. One station (Station ENV019) was classified as 'prime' in terms of habitat preference for sand eels spawning based on criteria defined by Latto *et al.* (2013) while seven stations (Stations ENV018, ENV034, ENV036, ENV076, ENV086, ENV087 and ENV089) were classified overall as 'sub-prime'.

A total of 25 pairs of *Arctica islandica* siphons were observed across 10 stations. This species is on the OSPAR (2008) list of threatened and/or declining species and habitats and is listed as a low or limited mobility species under Scotland's PMF (NatureScot, 2020). This species is commonly found within this area of the North Sea A total of 6 individuals of *Glyptoyephalus cynoglossus* were observed at 6 stations along the ECRs survey area and 33 individuals of *Melanogrammus aeglefinus* were observed at 18 stations. These species are both listed as vulnerable on the IUCN Global Red List (2023). There were 32 individuals of *Pleuronectes platessa* observed at 22 stations along the ECRs and 114 observations of *Merlangius merlangus* across 18 stations. These species are both listed on the Scottish Biodiversity List (NatureScot, 2020) and are both classified as a priority marine species under the UK post 2010 Biodiversity Framework (JNCC and Defra, 2012). A single *Modiolus modiolus* was identified in the imagery at Station ENV035. Whilst *M. modiolus* beds are listed under Annex I of the Habitats Directive (1992) and are classified as threatened and/or declining habitats (OSPAR, 2008), the density of individuals observed during the survey do not mee the criteria of this habitat.

Other than those habitats and species listed above, there was no further evidence from seabed imagery of any habitats listed under Annex I of the Habitats Directive (1992); species or habitats selected as PMF's (NatureScot, 2020); those listed on the Scottish Biodiversity List (NatureScot, 2020); species or habitat features of conservation interest (2018); species or habitats on the OSPAR (2008) list of threatened and/or declining species and habitats nor any species on the IUCN (2023) Global Red List of threatened species.

Across the survey area, sediments were recorded as heterogeneous and displayed wide-ranging particle size distributions, ranging from extremely poor to moderately well sorted. Most stations were classified as either fine sand (n=52; 39%), coarse silt (n=28; 21%), or very fine sand (n=26; 20%). When classified under Folk and Ward (1957), sediments were predominantly either muddy sand (n=57; 43%) or sand (n=42; 32%). Mean particle diameter ranged from 27µm to 2078µm with an average diameter of 173µm (±206SD).

With consideration of the PSA and imagery, the heterogenous survey was classified to Level 4 EUNIS habitat codes. A total of 64 stations were classified as MD52 (Atlantic Offshore Circalittoral Sand), 59 stations were classified as MC62 (Atlantic Circalittoral Mud), 8 stations were classified as MD32 (Atlantic Offshore Circalittoral mixed sediment) and 2 stations were classified as MC32 (Atlantic Circalittoral coarse sediment).

UKBAP	United Kingdom Biodiversity Action Plan
UKCS	United Kingdom Continental Shelf
UKOOA	United Kingdom Offshore Operators Association
USBL	Ultra Short Base Line
UTM	Universal Transverse Mercator

1 PROJECT SUMMARY

1.1 Scope of Work

During June to November 2023, Gardline Limited conducted an integrated survey on behalf of Morven Offshore Wind Limited along the export cable routes (ECRs) of the proposed Morven wind farm, situated in the central North Sea approximately 60km southeast of Aberdeen. The survey was conducted onboard the motor vessel *Ocean Geograph* between 19-Jun-2023 to 10-Nov-2023, with environmental operations undertaken between 04-Jul-2023 and 09-Nov-2023, details of the site location are displayed in Figure 1.1.

As detailed in the scope of work (SOW; bp, 2023), the overall survey aims were data collection to support the design of an ECR (approximately 260km in length) connecting the proposed Morven windfarm to shore. Two proposed ECRs joining the proposed wind farm and shore were investigated, as the final route was not yet decided. In order to inform the effective implementation of the ECR and satisfy environmental impact assessment and consenting processes, a multidisciplinary survey was required. The objective of the integrated survey included:

- to determine the characteristics of the seabed
- to characterise benthic communities (infauna and epifauna)
- to identify any environmentally sensitive habitats (*e.g.* potential Habitats Directive Annex I and priority marine features)

To meet the aims of the habitat assessment the presence of the following sensitive species and habitats were assessed:

- habitats, such as biogenic or rocky reefs, listed under Annex I of the Habitats Directive (1992), as implemented by the Conservation of Offshore Marine Habitats and Species Regulations (2019) and as endorsed by the Marine Environment Regulations (2018).
- habitats or species features of conservation importance (FOCI) and broadscale habitats, defined in relation to the Marine Conservation Zone network (Natural England and Joint Nature Conservation Committee, 2010) required under the Marine Conservation Regulations (2018).
- priority habitats or species in England, listed under Section 41 of the NERC Act (2006) and continue to be regarded as conservation priorities in the UK Post-2010 Biodiversity Framework (JNCC and Defra, 2012).
- species or habitats selected as PMFs in Scottish offshore waters (NatureScot, 2020) under the Marine Environmental Regulations (2019).
- species listed on the Scottish Biodiversity List (NatureScot, 2020) given credence under the UK Post-2010 Biodiversity Framework (JNCC and Defra, 2012).
- species or habitats on the OSPAR (2008) list of threatened and/or declining species and habitats.
- species listed on the IUCN Global Red List of threatened species (2023).

This report presents the results of the habitat assessment. The results of the environmental baseline survey report (Gardline, 2024c) and geotechnical surveys (Gardline, 2024a; Gardline, 2024b) are presented separately, with relevant results highlighted in this report.

All positional information in this report is referenced to International 1924 Ellipsoid, ED 1950. All grid coordinates are projected using UTM Projection, Grid Zone 30N, CM 3°W.

1.2 Environmental Survey Strategy

To enable clear and concise reporting, the naming convention of the stations has been shortened by the removal of the 'BP23MVEXP-ENV-DC/GS/WS-' station identifier. These shortened names have been used throughout the report where possible, though the original full names have been retained in the image file names and on the video overlays. The full and abbreviated station names have been presented in Table 1.1 along with details of the final target coordinates and data acquired. The actual position of the grab samples and seabed imagery, which may be offset from the intended target, are presented in the positional logs within Appendix A and plotted in Appendix C.

In order to meet the objectives of the SOW (bp, 2023), a total of 133 stations were pre-selected as part of a benthic survey desktop study of publicly available data prior to survey acquisition (Gardline, 2023). This comprised 56 stations (ENV001 to ENV056) located along the eastern route, 58 stations (ENV071 to ENV128) along the western route and 19 stations (ENV57 to ENV70 and ENV129 to ENV133) situated across the options for landfall. All stations were selected at approximately 4km intervals, of these stations, 22 were located in Scottish waters and the remainder were located in English waters. To check that the proposed cable routes were clear of archaeological artefacts and UXO for grab sampling operations, MBES, magnetometer and SSS reconnaissance lines were run over each station target. Details of the targets including their reason for selection, relative location and anticipated findings are presented in Table 1.1.

At all 133 stations drop-down camera data were successfully acquired, with seven re-runs conducted across five stations due to bad weather, no HD video being captured or low image quality when using the freshwater lens. Station ENV021 was abandoned due to poor weather, it was then reattempted as Station ENV021a; however, due to equipment issues no HD video was recorded. Imagery acquisition was successfully acquired from another deployment: Station ENV021b. Station ENV031a was abandoned due to bad weather and successfully reattempted as Station ENV031b. Due to turbidity at Station ENV067, imagery acquisition was originally attempted with the use of a freshwater lens (Station ENV067a); however, due to poor quality images the station was successfully reattempted (Station ENV067b) using the shallow water camera system. Due to equipment issues no HD video was recorded at Station ENV111; therefore, the station was successfully reattempted as Station ENV111a. Due to turbidity at Station ENV132, imagery acquisition was originally attempted with the use of a freshwater lens; however, due to poor quality images the station was successfully reattempted (Station ENV132a) using the shallow water camera system. As per the Benthic Scoping Document (Gardline, 2023) all transects were at least 200m in length and arranged in a cruciform arrangement. A deviation from the SOW was approved on the 19-Oct-2023 to allow for drop-down video transects for seabed clearance for CPT and vibrocore sampling. These images were not analysed.

A minimum of three grab samples were proposed every 4km using a 0.1m^2 Day grab for analysis of particle size, environmental DNA (eDNA) and macrofaunal community. An additional grab sample was acquired at 68 stations for chemical analysis including stations ENV030 to ENV035 due to close proximity to the North East of Farnes Deep highly protected marine area (HPMA). Following several unsuccessful attempts, six stations were abandoned due to; misfires of the grab, low sample retention, rocks stuck in the grab jaws or the presence of Myxinidae. Details on grab samples and sub-samples for each station are summarised in Table 1.1.

1 Final environmental target locations. Actual sampling positions for each individual grab sample are detailed in Appendix A

2 Sampling was abandoned at Stations ENV020, ENV035, ENV052, ENV067A, ENV068, ENV070 due to low retention, rocks in the jaws and the sampler misfiring.

3 One macrofaunal samples (MFA) sieved through a 0.5mm mesh was sent to be analysed, the other (MFB) kept as a spare at room temperature. Analysis methods are as detailed in Appendix B.

4 Grey text indicates eDNA samples were collected but not analysed.

5 Where available, one spare sub-sample was stored in a 1l glass jar available for chemistry analysis (MMO specification), one sub-sample was stored in a 120ml amber glass jar and available for hydrocarbons, organotin and PCB analysis, up to three sub-samples were stored in double-lined zip-lock bags and available for analysis of metal, particle size, eDNA and fish eDNA if required.

1.3 Background Habitat Information

1.3.1 Overview

This section presents an overview of the habitats and faunal communities expected to occur (or were potentially highlighted in the field report) within UK and Scottish waters in the vicinity of the proposed Morven ECR.

1.3.2 Sea Pen and Burrowing Megafauna Communities

A 'sea pen and burrowing megafauna communities' habitat is classified as a threatened and/or declining habitat (OSPAR, 2008). It is defined by OSPAR (2010) as plains of fine mud, extending over an area of at least 25m^2 and at water depths ranging from 15m to 200m or more. These areas are defined as being heavily bioturbated by burrowing megafauna including *Nephrops norvegicus*, *Calocaris macandreae* or *Callianassa subterranea*, with burrows and mounds typically forming a prominent feature of the sediment surface, and which may include conspicuous populations of sea pens (Pennatuloidea); typically, *Virgularia mirabilis* and *Pennatula phosphorea*. Despite its classification as a threatened and/or declining habitat (OSPAR, 2008); this habitat is widespread throughout the central North Sea, around the south and west coasts of Norway and around the north of the British Isles (OSPAR, 2010).

1.3.3 Rocky Reefs

Reefs are one of the habitats of conservation significance listed under Annex I of the Habitats Directive (1992) for protection within Special Areas of Conservation (SAC). Although there is no definition of reefs in the Habitats Directive itself, European interpretation of the habitat has been discussed and agreed upon as including bedrock, stony and biogenic reefs. Rocky reefs (bedrock and stony) can be extremely variable, both in structure and in the communities they support. A wide range of topographical reef forms meet the European definition of this habitat type, including vertical rock walls, horizontal ledges, sloping or flat bed rock, broken rock, boulder fields and aggregations of cobbles (McLeod *et al.*, 2009).

Stony reefs can comprise areas of boulders or cobbles that stand proud from the seafloor and can provide a suitable substratum for the attachment of benthic communities of algae and marine fauna. Cobbles and boulders are generally considered to be greater than 64mm in diameter and a feature of a stony reef must be that it is topographically distinct from the surrounding seafloor (Irving, 2009).

Bedrock reefs occur where bedrock arises from the surrounding seabed creating a habitat that is colonised by a distinct faunal community (JNCC, 2014a).

1.3.4 Herring Spawning

The Atlantic herring; *Clupea harengus*, is a schooling, coastal pelagic species that inhabits both sides of the Atlantic Ocean (Reid *et al.*, 1999). Herring is one of the most important UK commercial marine species. It is also highly vulnerable to both fishing pressures and activities associated with the renewable industry (Gill *et al.*, 2012; Kikuchi, 2010).

Herring are reported to deposit their sticky demersal eggs on a variety of substrates ranging from boulders, rocks, small stones, coarse sand, shell fragments, macrophytes and man-made structures such as lobster pots. However, gravel is widely considered to be the preferred spawning substrate (Rogers & Stocks, 2001; Ellis *et al.*, 2012). The eggs adhere to the seabed, forming extensive egg beds. According to Reid *et al.* (1999), spawning occurs in areas of well-mixed water with reasonably strong tidal currents (1.5 to 3 knots), often on shoals and banks in relatively shallow water (approximately 15-40m deep). These high-energy environments provide aeration and reduce siltation and accumulation of metabolites (Stevenson & Scott, 2005). The negative

impacts of the oil and gas industry on herring spawning grounds are primarily due to the risk of smothering from drill cuttings and disturbed sediment during installation/drilling.

1.3.5 Sand Eel Spawning

Sand eels are small eel-like fish which swim in large shoals and are an important component of marine food webs providing food for many species of marine predators including seabirds, mammals and commercially important species such as; *Gadus morhua*, and *Melanogrammus aeglefinus* (Holland *et al.*, 2005; Jensen *et al.*, 2010). Of the five species of sand eels inhabiting the North Sea, *Ammodytes marinus* is the most abundant and comprises 90% of sand eel fishery catches (ICES, 1997).

As with other sand eel species *A. maurinus* has a close association with sandy substrates into which they burrow. It is common for sand eels to prefer sandy sediments to those comprised predominately of gravel or silt (Pinto *et al.*, 1984) and they preferentially inhabit the sloping sides of sand banks (Wright *et al.*, 1998). Depth also has an influence; with sand eels being found at depths of 15 to 120m and with greater frequency at 30 to 70m (Wright *et al.*, 2000).

Spawning is suggested to occur between November and February (Coull *et al.*, 1998; Ellis *et al.*, 2010; 2012) where sand eels will spawn on the seabed and the eggs attach themselves to grains of sand (Hassel *et al.*, 2002). Sand eels hibernate in the sand during winter and bury themselves at night, so are most likely to be seen during the day between April and July. Physical disturbance to sand eel habitats may occur during operations including drilling and/or cable laying activities due to the resulting temporary sediment resuspension and increased turbidity (Bat *et al.*, 2013). These activities can therefore result in increased mortality, although it is expected that the population would recover following construction periods (Jensen *et al.*, 2010).

2 RESULTS AND DISCUSSION

2.1 Geophysical Survey Overview

Geophysical data were successfully acquired across the Morven ECR routes, this included an initial geophysical clearance phase of the sampling locations to complete environmental and geotechnical operations.

The geophysical requirement for this project was to acquire 2 lines at 80m spacing along all of the ECR sections with around 1000 line km to be acquired, utilising MBES, SSS and SBP. No final interpretation of the datasets was undertaken.

2.2 Seabed Imagery Observations

A selection of seabed photographs, together with descriptions and positions, are presented in Appendix C, whilst a summary of all taxa identified from each station is presented in Appendix D and example images of each taxa are presented in Appendix E. Seabed imagery across the proposed ECRs confirmed the sediment ranged from muddy sand to coarse sand with gravel and occasional cobbles and boulders in some areas.

Visible fauna identified to the lowest taxonomic level with confidence included:

- Annelida (*Aphrodita aculeata, Hyalinoecia tubicola, Myxicola, Oxydromus flexuosus,* Terebellidae)
- Arthropoda (*Cancer pagurus,* Caridea, Cirripedia, *Corystes cassivelaunus,* Decapoda, *Ebalia,* Galatheoidea*, Liocarcunus depurator, Lithodes maja, Macropodia, Munida rugosa, Necora puber, Nephrops norvegicus,* Paguroidea*, Pagurus prideaux,* Porcellanidae)
- Bryozoa (Flustridae*, Reteporella beaniana*)
- Chordata (Actinopterygii, *Agonus cataphractus, Amblyraja radiata,* Ammodytidae, Ascidiacea, *Callionymus lyra*, *Chelidonichthys cuculus,* Gadidae, *Glytocephalus cynoglossus, Lophius piscatorius,* Lotidae, *Melanogrammus aeglefinus*, *Merlangius merlangus, Myxine glutinosa, Platichthys flesus, Pleuronectes platessa,* Pleuronectiformes*,* Stichaeidae, Trigildae)
- Cnidaria (Actiniaria, *Actinauge richardi, Alcyonium digitatum, Calliactis palliata, Caryophyllia,* Ceriantharia, *Epizoanthus papillosus, Hydractinia echinata,* Hydrozoa, Metridiidae, *Nemertesia, Pennatula phosphorea, Thuiaria thuja, Tubularia indivisa, Urticina eques, Virgularia)*
- Echinodermata (*Asterias rubens,* Asteriodea, *Astropecten irregularis, Crossaster papposus, Echinocardium cordatum, Echinus esculentus, Henricia, Hippasteria phrygiana,* Holothuroidea*, Luidia ciliaris, Luidia sarsii, Ophiothrix fragilis, Ophiura albida, Ophiura ophiura,* Ophiuroidea*, Porania pulvillus, Spatangus purpureus, Stichastrella rosea*)
- Mollusca (*Arctica islandica* siphons, Bivalvia siphons, Buccinidae, Gastropoda, Loliginidae, *Modiolus modiolus,* Naticidae, Nudibranchia, *Pecten maximus,* Pectinidae, Scaphopoda, Sepiida)
- Porifera (Hard substrate sponges)

Additionally, faunal turf, Mollusca eggs and bioturbation in the form of tracks and burrows were observed. Anthropogenic debris was also observed in the form of fishing gear at Station ENV100.

Overall, fauna was typically sparse throughout the survey area, with 46% (n=3173) of stills containing no visible fauna. The most frequently observed taxa and/or features were burrows (present at 70 stations and in 16% of stills; n=1099), *Pennatula phosphorea* (present at 73 stations and in 12% of stills; n=815), faunal turf (present at 95 stations and in 8% of stills; n=545), Flustridae (present at 66 stations and in 7% of stills; n=452) and *Alcyonium digitatum* (present at 94 stations and in 6% of stills; n=404). All other fauna and/or features were observed in less than 5% of stills.

2.3 Sea Pen and Burrowing Megafauna Communities Assessment

Seabed imagery revealed that two species of sea pen (*P. phosphorea* and *Virgularia*) were present at 84 stations and burrows were present at 73 stations. Therefore, a detailed assessment of the 'sea pen and burrowing megafauna community' habitat as identified by OSPAR (2010) was conducted, referring to the MNCR SACFOR abundance scale (JNCC, 2013). Densities of sea pens were categorised using SACFOR classification to assess the similarity of the survey area to a 'sea pen and burrowing megafauna communities' habitat. Sea pen and burrow densities were calculated for each station using the total area covered by the seabed imagery (average swathe width x camera transect length). The results of this assessment are summarised in Table 2.1 and a map spatially illustrating abundance of sea pens and burrows is presented in Appendix C.

A total of 5031 individuals of *Pennatula phosphorea* were observed at 79 stations across the ECRs. Where observed, densities of *P. phosphorea* ranged from 0.005 individuals m^{-2} at Station ENV007 to 1.85 individuals m^{-2} at Station ENV048, with individuals measuring between 0.2cm and 11.4cm. In accordance with SACFOR, *P. phosphorea* were classified in a range that encompassed 'frequent' at 49 stations. Further, a total of 168 individuals of *Virgularia* were observed at 15 stations. The density of *Virgularia* varied between 0.005 individuals m^{-2} at Station ENV113 and 0.56 individuals m^{-2} at Station ENV059, with individuals measuring between 1.0cm and 15.3cm. In accordance with SACFOR, *Vigularia* were classified in a range that encompassed 'frequent' at 2 stations.

A total of 4547 burrows were recorded, with densities ranging from 0.005 burrows m^{-2} to 1.88 burrows m^{-2}. Burrows across the surveyed area were estimated to be between 0.5cm and 14.9cm in diameter. In accordance with the SACFOR classification scale, burrows were classified in a range than encompassed 'frequent' at 46 stations; all of which were in English waters and notably towards the south of the ECRs. Although burrows were present, burrowing fauna were rarely sighted (only 37 individuals of *Nephrops norvegicus* were observed) to confirm the burrow inhabitants; therefore, burrows could not confidently be attributed to any of the classified 'megafauna' species within the 'sea pen and burrowing megafauna community' habitat classification.

The JNCC (2014b) clarification report states that too be considered a 'sea pen and burrowing megafauna communities' habitat, densities of burrows and/or mounds, together with sea pens if present should be classified as 'frequent' or above on the SACFOR scale. The 46 stations, see Table 2.1, which burrows were classified in a range that encompassed 'frequent' can be considered to show some similarity to a 'sea pen and burrowing megafauna communities' habitat as per OSPAR (2010). Whilst this habitat is on the list of threatened and/or declining species and habitats, it is widespread throughout the Central North Sea, around the south and west coasts of Norway and around the north of the British Isles (OSPAR, 2010; Hill *et al.*, 2022). This habitat is also listed as a component biotope of the burrowed mud habitat which is a PMF (NatureScot, 2020); however, no stations in Scottish waters were classified in a range that encompassed 'frequent'.

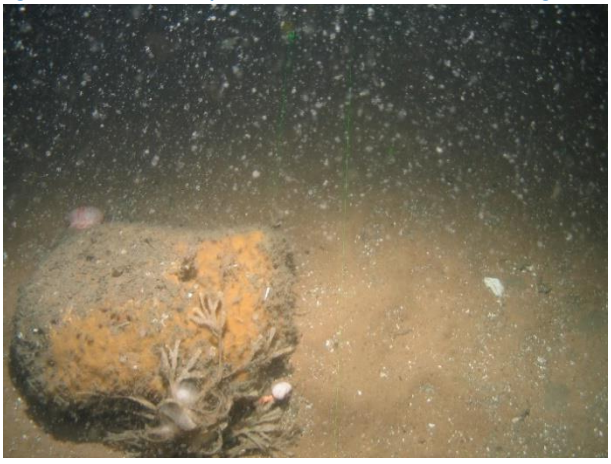
1 Total area of seabed photographed for station/transect calculated using laser line scaling

2 SACFOR classification scale S=Superabundant, A=Abundant, C=Common, F=Frequent, O=Occasional and R=Rare Classification based on minimum and maximum estimated size of sea pen and burrows and the respective mean density at each station and transect

Table 2.2 Application of SACFOR abundance ranges to OSPAR (2010) 'sea pen and burrowing megafauna communities' habitat

Ranges			
< Frequent No similarity	≤Frequent Some similarity	< and > Frequent Some Similarity	≥Frequent Greatest Similarity

2.4 Stony Reefs



Analysis for stony reef was conducted to determine resemblance, if any, to the protected habitat based on the criteria adopted by Irving (2009) as set out in Appendix B.5.2. Seabed imagery and sediment composition showed evidence of potential stony reef across the ECRs at sixteen stations in the form of isolated cobbles and/or boulders or isolated patches of cobbles or scattered cobbles.

There was little evidence of stony reef resemblance stations containing cobbles or boulders. Stations ENV020, ENV032, ENV035, ENV038, ENV050, ENV051, ENV052, ENV67b, ENV068, ENV069, ENV070, ENV073, ENV103, ENV105, ENV106 and ENV132a were matrix supported, with little relief overall and often comprised small patchy extents across larger swathes of gravel or coarse shell-based material such as examples given in Figure 2.1. At these stations, occurrences of individual images meeting one or more of the criteria were generally only in a few images or with wide separation between images; therefore, all these stations classified as having no resemblance to rocky reef (Table 2.3).

Additionally, at all stations analysed for stony reef, epifaunal coverage showed limited increase in areas of cobbles and boulders than the surrounding area. However, some examples of species known to be strong indicators of reef habitat were observed including *A. digitatum* and *T. indivisa.* However, these species were not limited to the areas of cobbles and/or boulders but rather were seen across all gravelly sediment types observed throughout the survey area.

Further, in an attempt to refine the criteria for defining areas with a 'low resemblance' to Annex I stony reef Golding *et al.* (2020) stated that in order to be regarded as having any resemblance to reef, a 25m^2 area of seabed must be composed of at least 10% cobbles and boulders with the faunal community dominated by epifaunal species. Where an area only meets the criteria for low resemblance (Table B.3), a strong justification would be required to consider the area as Annex I stony reef, further justifying the classification of stations as no having no resemblance to a stony reef.

Figure 2.1 Example Cobble Occurrences along Morven ECRs

Station: ENV020 Fix: 997 Isolated cobble on sand

Station: ENV070 Fix: 5809 Scattered cobbles and boulders on gravelly sand

Table 2.3 Stony Reef Assessment Summary

Station	Total Number of Images Assessed	Estimated Area Investigated (m^2)	Number of Images with Cobbles and/or Boulders	% of Images with Cobbles and/or Boulders	Number of Images with Low Resemblance (10-40% Cover)	% of images with Low Resemblance (10-40% Cover)	Number of Images with Medium Resemblance (40-95% Cover)	% of Images with Medium Resemblance (40-95% Cover)	Max Reef Height (cm)	Mean (and range) of Stony Reef Cover (%)	Estimated Total Reef Area (m^2)[1]	Resemblance to 'Stony Reef'	Comments
ENV020	68	411	31	46	25	37	2	3	6.3	18 (2 - 46)	1.74	None	Isolated cobbles on sand

ENV052	64	174	23	36	19	30	3	5	12.2	26 (8 - 71)	1.77	None	Scattered cobbles/boulders on sand
ENV067b	50	150	46	92	34	68	12	24	15.4	33 (9 - 79)	3.11	None	Scattered cobbles/boulders on gravelly sand
ENV068	57	179	41	72	38	67	2	4	10.7	26 (7 - 51)	2.83	None	Scattered cobbles/boulders on gravelly sand
ENV069	63	131	51	81	38	60	14	22	17.7	35 (8 - 66)	2.84	None	Scattered cobbles/boulders on gravelly muddy sand
ENV070	89	168	76	85	43	48	31	35	24.4	36 (7 - 81)	7.06	None	Scattered cobbles/boulders on gravelly sand
ENV073	51	151	1	2	1	2	0		4.9	47 (47 - 47)	0.21	None	Isolated boulder on muddy sand
ENV103	111	217	2	2	2	2	0		16	19 (8 - 30)	0.11	None	Isolated cobbles on muddy sand
ENV105	98	184	3	3	2	2	0		5.4	14 (8 - 25)	0.13	None	Isolated cobbles on muddy sand
ENV106	66	160	4	6	4	6	0		24.2	21 (12 - 35)	0.27	None	Isolated cobbles on muddy sand
ENV132a	45	104	2	4	2	4	0		0.7	16 (14 - 17)	0.03	None	Isolated patch of cobbles on muddy sand

1 Maximum reef height may be underestimated due to the absence of laser lines in some of images.

2 Stony reef coverage in images with no laser lines present was estimated based on average station image area.

2.5 Herring Spawning Ground Potential

Potential herring spawning grounds reportedly overlap with the Morven ECR survey area (Coull *et al.*, 1998). Consequently, all stations were reviewed for their spawning potential. Water depths across the survey area ranged from 24m to 104m LAT which lies within a suitable depth range for herring spawning (Frost & Diele, 2022).

Based on the criteria by Reach *et al.* (2013), and with consideration of Cefas (2001), as outlined in Appendix B.5.3, the spawning potential of each relevant aspect of each of the 128 stations where particle size analysis (PSA) data were collected, are displayed in Table 2.4. More detailed PSA results are presented in Section 2.9 and Appendix F.

Results of the PSA revealed that although coarse sand to gravel-sized sediment was a component of most stations, it accounted for <20% at most stations, and this was supported by seabed imagery. Six stations (Stations ENV037, ENV051, ENV076, ENV086, ENV092 and ENV131) recorded coarse sand to gravel sized material greater than 40% equating to sub-prime criteria or greater.

Of these six stations, only Stations ENV076 and ENV092 recorded <5% fines. Overall, in terms of habitat sediment preference, Station ENV076 with 26.1% gravel was considered ‘sub-prime’, whilst Station ENV092 with 63.5% gravel was considered ‘prime’. All other stations were considered unsuitable in terms of habitat sediment preference due to >5% fines and/or <10% gravel.

Station ENV092 offered the greatest potential for herring spawning from a habitat sediment classification perspective, being regarded as ‘preferred’ as they recorded a modified Folk (1954) classification of sandy gravel. Two further stations (Stations ENV033 and ENV076) were regarded as ‘marginal’ due to their modified Folk (1954) classification of gravelly sand, while all other stations were considered unsuitable.

In terms of sediment sorting, Stations ENV018 and ENV019 presented well sorted substrate however, these stations were dominated by fine and medium sand with <1% gravel and therefore are unlikely to offer a suitable habitat for herring spawning. A total of 33 stations presented either a moderately well or moderately sorted substrate but once again were dominated by fine to coarse sand with <3% gravel. All remaining stations presented poorly to extremely poorly sorted substrate. The lack of well sorted sediment may be indicative of less oxygenated sediments, which are less favourable conditions for herring spawning.

In summary, it was considered that Station ENV092 presented the greatest herring spawning potential as it met both the ‘prime’ habitat sediment preference and ‘preferred’ sediment classification as set out by Reach *et al.* (2013). This was also the only station to record a sufficiently high percentage of gravel (>50%) in terms of habitat sediment preference for herring spawning.

Table 2.4 Summary of Herring Spawning Potential

Station	Dominant Grain Size			Habitat Sediment Preference[1]			Habitat Sediment Classification[2]

Classification criteria are detailed in Section B.5.3.

1 Habitat Sediment Preference - Colours indicate where Prime, Sub-Prime, Suitable or Unsuitable spawning potential criteria were met (Reach *et al.*, 2013).

2 Habitat Sediment Classification - Colours indicate where Preferred, Marginal or Unsuitable spawning potential criteria were met (Reach *et al.*, 2013).

2.6 Sand Eel Spawning

The Morven ECRs lie within a low intensity spawning ground and nursery ground for sand eels (Cefas, 2010; Coull *et al.*, 1998) and a single Ammodytidae individual was observed at Station ENV043. Additionally, the water depth for the survey area was between 24m and 104m LAT which is within the sand eels preferred depth range. All stations where PSA samples were acquired have been reviewed for their suitability as a spawning ground for sand eels. Based on criteria defined by Latto *et al.* (2013) as outlined in Appendix B, the sand eel spawning potential of each relevant aspect of the 128 stations where PSA data were collected, is displayed in Table 2.5. More detailed PSA results are presented in Section 2.9 and Appendix F.

A total of 49 stations met at least one of the suitability criteria in that they recorded >50% sand and <10% fine sediment. All these stations met the 'preferred' habitat sediment classification of sand, slightly gravelly sand and gravelly sand. Of these, 41 stations were considered 'suitable' in terms of the sediment preference for spawning and nursery grounds and 7 stations were considered 'Sub-Prime'. Station ENV019 offered the greatest potential for sand eel spawning, being regarded as 'Prime' in terms of habitat sediment preference as it recorded <1% fines and >85% sand.

The remaining stations were all considered 'unsuitable' in terms of habitat sediment preference recording >10% fines. Station ENV092 was considered 'marginal' due to it recording a modified Folk (1954) classification of sandy gravel.

Although the use of imagery alone does not provide sufficient detail to definitively determine sand eel spawning potential, at stations where PSA samples were not successfully collected imagery showed the presence of a high gravel content and potential rocky reef suggesting these stations would likely not meet the requirements to be a suitable spawning ground for sand eels. The survey was conducted between June and November and thus occurred outside of the typical sand eel spawning period of November and February.

Table 2.5 Summary of Sand Eel Spawning Potential

ENV132	37.6	62.3	Unsuitable	Muddy sand	Unsuitable
ENV133	57.3	42.4	Unsuitable	Sandy mud	Unsuitable

Classification criteria are detailed in Appendix B.5.4.

1 Habitat Sediment Preference - Colours indicate where Prime, Sub-Prime, Suitable or Unsuitable spawning potential criteria were met (Latto *et al.*, 2013).

2 Habitat Sediment Classification - Colours indicate where Preferred, Marginal or Unsuitable spawning potential criteria were met (Latto *et al.*, 2013) based on either the sand and fines criteria or the generalised criteria.

2.7 Other Species of Conservation Interest

A total of 25 pairs of *A. islandica* siphons and one dead *A. islandica* shell were observed across 10 stations. This species is listed on the OSPAR (2008) list of threatened and/or declining species and habitats. In addition, it is listed as a low or limited mobility species PMF in Scottish offshore waters (NatureScot, 2020) and is a qualifying feature for the Farnes East marine protected area (MPA; JNCC, 2020). However, this species is commonly found within this area of the North Sea.

A total of 33 individuals of *M. aeglefinus* were observed across 18 stations and 6 individuals of *G. cynoglossus* were observed across 6 stations. Both species are listed as vulnerable on the IUCN Global Red List (2023).

Two individuals of *A. radiata* were observed across 2 stations. This species is listed as vulnerable on the IUCN Global Red List (2023); however, it is considered as least concern in European waters.

A total of 31 *P. platessa* individuals were observed across 21 stations. This species is classified as a priority species under the UK Post 2010 Biodiversity Framework (JNCC and Defra, 2012) and is listed on the Scottish Biodiversity List (NatureScot, 2020).

There were 114 observations of *M. merlangus* across 8 stations. This species is listed on the Scottish Biodiversity List (NatureScot, 2020), as well as appearing as a priority marine species under the UK Post 2010 Biodiversity Framework (JNCC and Defra, 2012).

A single *M. modiolus* was identified in the imagery at Station ENV035. Whilst *M. modiolus* beds are listed under Annex I of the Habitats Directive (1992) and are classified as threatened and/or declining habitats (OSPAR, 2008), the density of individuals observed during the survey do not meet the criteria of this habitat.

Other than those habitats and species listed above, there was no further evidence from seabed imagery of any habitats listed under Annex I of the Habitats Directive (1992), any other species or habitats listed as PMFs (NatureScot, 2020). Nor any species listed on the Scottish Biodiversity List (NatureScot, 2020), species or habitats listed on the OSPAR (2008) list of threatened and/or declining species and habitats, nor any species on the IUCN Global Red List (IUCN, 2023).

2.8 Sediment Sampling Observations

Sediment sampling was conducted at 133 stations across the survey area, of these the required full suite was collected at 127 stations. All successful samples were acquired using a 0.1m^2 Day grab. Environmental deck and positioning logs are presented in Appendix A with example images presented in Appendix C.

Across the survey area, areas of heterogeneous sediment which included a high proportion of gravel and cobbles tended to recover smaller samples. Of the six stations (ENV020, ENV035, ENV052, ENV067a, ENV068 and ENV070) where the full suite was not obtained, no successful samples were obtained for four stations (ENV035, ENV067a, ENV068 and ENV070). Multiple attempts were made at all stations to acquire samples and at Station ENV035 after multiple attempts with the Day grab the mini-Hamon grab was deployed but still did not yield a successful sample. At the four stations where no samples were obtained, cobbles and boulders were observed in seabed imagery which impacted sampling attempts.

Overall, a total of 448 grab samples were acquired from 543 attempts (83% success rate). Of these retained samples, 99.6% were acquired within 10m of the target location (n=4446) and the remaining two samples were acquired within 20m of the target. Where sampling attempts failed multiple times, the grab was redeployed 10m

from the original target location. On average, samples were obtained within 1.8m of the target locations (±1.6SD) with the maximum distance between target and sampling location being 11.2m. The 95 unsuccessful sampling attempts were spread across 35 stations and were due to low sample retention (43%), rocks stuck in the grab jaws (36%), misfires of the grab (19%) or the presence of Myxinidae (3%).

Seabed sampling supported the initial interpretation of the seabed imagery findings, confirming that the seabed comprised sandy sediments with varying amounts of fines, shell fragments and occasional areas of sandy or muddy sediments with cobbles and gravels.

Visible fauna observed within the retrieved grab were limited and included:

- Annelida (Polychaeta)
- Arthropoda (Brachyura, Decapoda, *Nephrops norvegicus,* Paguroidea)
- Bryozoa (Flustridae)
- Cnidaria (Hydrozoa, Pennatuloidea)
- Echinodermata (Asteroidea, *Echinocardium cordatum*, Ophiuroidea)
- Mollusca (*A islandica,* Bivalvia, Gastropoda, Scaphopoda).

2.9 Particle Size Analysis

The PSA results, determined using wet and dry sieving, are presented in Table 2.6. Full PSA results from the current survey, including histograms illustrating the particle size distribution at each of the sampled stations are presented in Appendix F. The results of the PSA were consistent with the seabed imagery observations and recovered sediment samples.

Across the survey area, sediments were recorded as heterogeneous and displayed wide-ranging particle size distributions under Folk & Ward (1957), ranging from extremely poor to moderately well sorted. Mean particle size diameter varied from 27µm at Stations ENV059 to 2078µm at Station ENV092. Excluding the four stations that recorded the largest mean grain size (Stations ENV092, ENV076, ENV087 and ENV037), the mean particle diameter varied from 27µm to 422µm. Across the survey area, a significant correlation between increasing water depth (m) and decreasing mean grain size (µm) was observed.

Of the 128 stations where PSA was collected, 12 had negligible (<5%) fines content (<63µm; silt and clay) with a further 38 having fines content >10%. Gravel (>2µm) content was <1% at most stations (n=110) and was >15% at four stations (Stations ENV066, ENV076, ENV092 and ENV037). Most stations were classified as either fine sand (n=52; 39%), coarse silt (n=28; 21%), or very fine sand (n=26; 20%) under Wentworth (1922). Stations were generally poorly sorted (poor to extremely poor; n=83, 62%) and had leptokurtic distributions (leptokurtic to extremely leptokurtic; n=83, 62%). When classified under Folk and Ward (1957) sediments were predominantly either muddy sand (n=57; 43%) or sand (n=42; 32%), these stations recorded modal phi values between 1.0 and 4.0 (Appendix F).

Table 2.6 Sediment Characteristics

Station	Mean Diameter (µm)	Mean Diameter (phi)	Fines %	Sand %	Gravel %	Wentworth Classification of Mean Grain Size	Sorting[1]	Modified Folk Classification

Sediments were not treated to remove carbonates prior to particle size analyses.

1 Sorting according to Folk and Ward (1957).

2.10 EUNIS Habitat Classification

Each seabed photograph and captured seabed image was assigned a EUNIS habitat code based on depth, sediment type and observed fauna. There results were then reviewed alongside PSA to assign EUNIS habitat code(s) to each station as a whole. Results of the EUNIS habitat classification for each station are summarised in Table 2.7.

All habitats observed related to the EUNIS level one environmental marine habitats (EUNIS habitats type code M).

There were 64 stations with a predominantly sandy soft substrate classified overall as:

- EUNIS habitat code MD5 (Offshore Circalittoral Sand)
- EUNIS biotope complex MD52 (Atlantic Offshore Circalittoral sand)

A further 59 stations with predominantly muddy, soft substrate classified overall as:

- EUNIS habitat code MC6 (Circalittoral Mud)
- EUNIS biotope complex MC62 (Atlantic Circalittoral Mud)

Eight stations consisted of muddy sandy sediment with gravel classified as:

- EUNIS habitat code MD3 (Offshore Circalittoral Mixed sediment)
- EUNIS biotope complex MD32 (Atlantic Offshore Circalittoral Mixed Sediment)

Stations ENV092 and ENV131 both consisted of coarse sediment and where therefore classified as:

- EUNIS habitat code MD4 (Offshore Circalittoral Coarse sediment)
- EUNIS biotope complex MD42 (Atlantic Offshore Circalittoral Coarse sediment)

Table 2.7 EUNIS Habitat Classification

APPENDIX A FIELD SAMPLING LOGS

Gardline — Seafloor Sampling Positioning Summary

Job No	54027			Vessel	*Ocean Geograph*						
Client	Morven Offshore Wind Limited			Vessel Reference Point (VRP)	COG						
Project Name	Morven ECR			Deployment Location	Environmental A frame	x	9.31	y	-14.81	z	5.97
Primary Positioning System	StarPack1			Actual Coordinates derived from	Beacon						
Geodetic Reference System	Datum	WGS 84 (18) to ED50	Ellipsoid	International 1924	Projection	UTM zone 30N			Vertical / Tidal Datum	LAT

APPENDIX A FIELD SAMPLING LOGS

Gardline — Seafloor Sampling Positioning Summary

Job No	54027			Vessel	*Ocean Geograph*						
Client	Morven Offshore Wind Limited			Vessel Reference Point (VRP)	COG						
Project Name	Morven ECR			Deployment Location	Environmental A frame	x	9.31	y	-14.81	z	5.97
Primary Positioning System	StarPack1			Actual Coordinates derived from	Beacon						
Geodetic Reference System	Datum	WGS 84 (18) to ED50	Ellipsoid	International 1924	Projection	UTM zone 30N		Vertical / Tidal Datum	LAT		

Date	Time (UTC/GMT)	Fix number	Stn No	Penetration	Sample Retention	Retention	Observed Seafloor Depth (m)	Actual coordinates		Target coordinates		Offset from target				Surveyor	Remarks
								Easting	Northing	Easting	Northing	dE	dN	Range	Bearing

APPENDIX A FIELD SAMPLING LOGS

Seafloor Sampling Positioning Summary

Job No	54027			Vessel	*Ocean Geograph*						
Client	Morven Offshore Wind Limited			Vessel Reference Point (VRP)	COG						
Project Name	Morven ECR			Deployment Location	Environmental A frame	x	9.31	y	-14.81	z	5.97
Primary Positioning System	StarPack1			Actual Coordinates derived from	Beacon						
Geodetic Reference System	Datum	WGS 84 (18) to ED50	Ellipsoid	International 1924	Projection	UTM zone 30N			Vertical / Tidal Datum	LAT	

Date	Time (UTC/GMT)	Fix number	Stn No	Penetration	Sample Retention	Retention	Observed Seafloor Depth (m)	Actual coordinates		Target coordinates		Offset from target				Surveyor	Remarks
								Easting	Northing	Easting	Northing	dE	dN	Range	Bearing

APPENDIX A FIELD SAMPLING LOGS

Seafloor Sampling Positioning Summary

Job No	54027			Vessel	*Ocean Geograph*						
Client	Morven Offshore Wind Limited			Vessel Reference Point (VRP)	COG						
Project Name	Morven ECR			Deployment Location	Environmental A frame	x	9.31	y	-14.81	z	5.97
Primary Positioning System	StarPack1			Actual Coordinates derived from	Beacon						
Geodetic Reference System	Datum	WGS 84 (18) to ED50	Ellipsoid	International 1924	Projection	UTM zone 30N			Vertical / Tidal Datum	LAT	

Date	Time (UTC/GMT)	Fix number	Stn No	Penetration	Sample Retention	Retention	Observed Seafloor Depth (m)	Actual coordinates		Target coordinates		Offset from target				Surveyor	Remarks
								Easting	Northing	Easting	Northing	dE	dN	Range	Bearing

APPENDIX A FIELD SAMPLING LOGS

Seafloor Sampling Positioning Summary

Job No	54027			Vessel	*Ocean Geograph*						
Client	Morven Offshore Wind Limited			Vessel Reference Point (VRP)	COG						
Project Name	Morven ECR			Deployment Location	Environmental A frame	x	9.31	y	-14.81	z	5.97
Primary Positioning System	StarPack1			Actual Coordinates derived from	Beacon						
Geodetic Reference System	Datum	WGS 84 (18) to ED50	Ellipsoid	International 1924	Projection	UTM zone 30N		Vertical / Tidal Datum	LAT		

Date	Time (UTC/GMT)	Fix number	Stn No	Penetration	Sample Retention	Retention	Observed Seafloor Depth (m)	Actual coordinates		Target coordinates		Offset from target				Surveyor	Remarks
								Easting	Northing	Easting	Northing	dE	dN	Range	Bearing

APPENDIX A FIELD SAMPLING LOGS

Gardline — Seafloor Sampling Positioning Summary

Job No	54027			Vessel	*Ocean Geograph*						
Client	Morven Offshore Wind Limited			Vessel Reference Point (VRP)	COG						
Project Name	Morven ECR			Deployment Location	Environmental A frame	x	9.31	y	-14.81	z	5.97
Primary Positioning System	StarPack1			Actual Coordinates derived from	Beacon						
Geodetic Reference System	Datum	WGS 84 (18) to ED50	Ellipsoid	International 1924	Projection	UTM zone 30N			Vertical / Tidal Datum	LAT	

Date	Time (UTC/GMT)	Fix number	Stn No	Penetration	Sample Retention	Retention	Observed Seafloor Depth (m)	Actual coordinates		Target coordinates		Offset from target				Surveyor	Remarks
								Easting	Northing	Easting	Northing	dE	dN	Range	Bearing

APPENDIX A FIELD SAMPLING LOGS

Gardline — Seafloor Sampling Positioning Summary

Job No	54027			Vessel	*Ocean Geograph*						
Client	Morven Offshore Wind Limited			Vessel Reference Point (VRP)	COG						
Project Name	Morven ECR			Deployment Location	Environmental A frame	x	9.31	y	-14.81	z	5.97
Primary Positioning System	StarPack1			Actual Coordinates derived from	Beacon						
Geodetic Reference System	Datum	WGS 84 (18) to ED50	Ellipsoid	International 1924	Projection	UTM zone 30N			Vertical / Tidal Datum	LAT	

Date	Time (UTC/GMT)	Fix number	Stn No	Penetration	Sample Retention	Retention	Observed Seafloor Depth (m)	Actual coordinates		Target coordinates		Offset from target				Surveyor	Remarks
								Easting	Northing	Easting	Northing	dE	dN	Range	Bearing

APPENDIX A FIELD SAMPLING LOGS

Gardline — Seafloor Sampling Positioning Summary

Job No	54027			Vessel	*Ocean Geograph*						
Client	Morven Offshore Wind Limited			Vessel Reference Point (VRP)	COG						
Project Name	Morven ECR			Deployment Location	Environmental A frame	x	9.31	y	-14.81	z	5.97
Primary Positioning System	StarPack1			Actual Coordinates derived from	Beacon						
Geodetic Reference System	Datum	WGS 84 (18) to ED50	Ellipsoid	International 1924	Projection	UTM zone 30N			Vertical / Tidal Datum	LAT	

Date	Time (UTC/GMT)	Fix number	Stn No	Penetration	Sample Retention	Retention	Observed Seafloor Depth (m)	Actual coordinates		Target coordinates		Offset from target				Surveyor	Remarks
								Easting	Northing	Easting	Northing	dE	dN	Range	Bearing

APPENDIX A FIELD SAMPLING LOGS

Gardline — Seafloor Sampling Positioning Summary

Job No	54027			Vessel	*Ocean Geograph*						
Client	Morven Offshore Wind Limited			Vessel Reference Point (VRP)	COG						
Project Name	Morven ECR			Deployment Location	Environmental A frame	x	9.31	y	-14.81	z	5.97
Primary Positioning System	StarPack1			Actual Coordinates derived from	Beacon						
Geodetic Reference System	Datum	WGS 84 (18) to ED50	Ellipsoid	International 1924	Projection	UTM zone 30N			Vertical / Tidal Datum	LAT	

Date	Time (UTC/GMT)	Fix number	Stn No	Penetration	Sample Retention	Retention	Observed Seafloor Depth (m)	Actual coordinates		Target coordinates		Offset from target				Surveyor	Remarks
								Easting	Northing	Easting	Northing	dE	dN	Range	Bearing

APPENDIX A FIELD SAMPLING LOGS

Gardline — Seafloor Sampling Positioning Summary

Job No	54027			Vessel	*Ocean Geograph*						
Client	Morven Offshore Wind Limited			Vessel Reference Point (VRP)	COG						
Project Name	Morven ECR			Deployment Location	Environmental A frame	x	9.31	y	-14.81	z	5.97
Primary Positioning System	StarPack1			Actual Coordinates derived from	Beacon						
Geodetic Reference System	Datum	WGS 84 (18) to ED50	Ellipsoid	International 1924	Projection	UTM zone 30N			Vertical / Tidal Datum	LAT	

Date	Time (UTC/GMT)	Fix number	Stn No	Penetration	Sample Retention	Retention	Observed Seafloor Depth (m)	Actual coordinates		Target coordinates		Offset from target				Surveyor	Remarks
								Easting	Northing	Easting	Northing	dE	dN	Range	Bearing

APPENDIX A FIELD SAMPLING LOGS

Seafloor Sampling Positioning Summary

Job No	54027			Vessel	*Ocean Geograph*						
Client	Morven Offshore Wind Limited			Vessel Reference Point (VRP)	COG						
Project Name	Morven ECR			Deployment Location	Environmental A frame	x	9.31	y	-14.81	z	5.97
Primary Positioning System	StarPack1			Actual Coordinates derived from	Beacon						
Geodetic Reference System	Datum	WGS 84 (18) to ED50	Ellipsoid	International 1924	Projection	UTM zone 30N			Vertical / Tidal Datum	LAT	

Date	Time (UTC/GMT)	Fix number	Stn No	Penetration	Sample Retention	Retention	Observed Seafloor Depth (m)	Actual coordinates		Target coordinates		Offset from target				Surveyor	Remarks
								Easting	Northing	Easting	Northing	dE	dN	Range	Bearing

APPENDIX A FIELD SAMPLING LOGS

Gardline — Seafloor Sampling Positioning Summary

Job No	54027			Vessel	*Ocean Geograph*						
Client	Morven Offshore Wind Limited			Vessel Reference Point (VRP)	COG						
Project Name	Morven ECR			Deployment Location	Environmental A frame	x	9.31	y	-14.81	z	5.97
Primary Positioning System	StarPack1			Actual Coordinates derived from	Beacon						
Geodetic Reference System	Datum	WGS 84 (18) to ED50	Ellipsoid	International 1924	Projection	UTM zone 30N		Vertical / Tidal Datum	LAT		

Date	Time (UTC/GMT)	Fix number	Stn No	Penetration	Sample Retention	Retention	Observed Seafloor Depth (m)	Actual coordinates		Target coordinates		Offset from target				Surveyor	Remarks
								Easting	Northing	Easting	Northing	dE	dN	Range	Bearing

APPENDIX A FIELD SAMPLING LOGS

Gardline — Seafloor Sampling Positioning Summary

Job No	54027			Vessel	*Ocean Geograph*						
Client	Morven Offshore Wind Limited			Vessel Reference Point (VRP)	COG						
Project Name	Morven ECR			Deployment Location	Environmental A frame	x	9.31	y	-14.81	z	5.97
Primary Positioning System	StarPack1			Actual Coordinates derived from	Beacon						
Geodetic Reference System	Datum	WGS 84 (18) to ED50	Ellipsoid	International 1924	Projection	UTM zone 30N			Vertical / Tidal Datum	LAT	

Date	Time (UTC/GMT)	Fix number	Stn No	Penetration	Sample Retention	Retention	Observed Seafloor Depth (m)	Actual coordinates		Target coordinates		Offset from target				Surveyor	Remarks
								Easting	Northing	Easting	Northing	dE	dN	Range	Bearing

APPENDIX A FIELD SAMPLING LOGS

Gardline — Seafloor Sampling Positioning Summary

Job No	54027			Vessel	*Ocean Geograph*						
Client	Morven Offshore Wind Limited			Vessel Reference Point (VRP)	COG						
Project Name	Morven ECR			Deployment Location	Environmental A frame	x	9.31	y	-14.81	z	5.97
Primary Positioning System	StarPack1			Actual Coordinates derived from	Beacon						
Geodetic Reference System	Datum	WGS 84 (18) to ED50	Ellipsoid	International 1924	Projection	UTM zone 30N			Vertical / Tidal Datum	LAT	

Date	Time (UTC/GMT)	Fix number	Stn No	Penetration	Sample Retention	Retention	Observed Seafloor Depth (m)	Actual coordinates		Target coordinates		Offset from target				Surveyor	Remarks
								Easting	Northing	Easting	Northing	dE	dN	Range	Bearing

APPENDIX A FIELD SAMPLING LOGS

Gardline — Seafloor Sampling Positioning Summary

Job No	54027			Vessel	*Ocean Geograph*						
Client	Morven Offshore Wind Limited			Vessel Reference Point (VRP)	COG						
Project Name	Morven ECR			Deployment Location	Environmental A frame	x	9.31	y	-14.81	z	5.97
Primary Positioning System	StarPack1			Actual Coordinates derived from	Beacon						
Geodetic Reference System	Datum	WGS 84 (18) to ED50	Ellipsoid	International 1924	Projection	UTM zone 30N		Vertical / Tidal Datum	LAT		

Date	Time (UTC/GMT)	Fix number	Stn No	Penetration	Sample Retention	Retention	Observed Seafloor Depth (m)	Actual coordinates		Target coordinates		Offset from target				Surveyor	Remarks
								Easting	Northing	Easting	Northing	dE	dN	Range	Bearing

APPENDIX A FIELD SAMPLING LOGS

Gardline — Seafloor Sampling Positioning Summary

Job No	54027			Vessel	*Ocean Geograph*						
Client	Morven Offshore Wind Limited			Vessel Reference Point (VRP)	COG						
Project Name	Morven ECR			Deployment Location	Environmental A frame	x	9.31	y	-14.81	z	5.97
Primary Positioning System	StarPack1			Actual Coordinates derived from	Beacon						
Geodetic Reference System	Datum	WGS 84 (18) to ED50	Ellipsoid	International 1924	Projection	UTM zone 30N			Vertical / Tidal Datum	LAT	

Date	Time (UTC/GMT)	Fix number	Stn No	Penetration	Sample Retention	Retention	Observed Seafloor Depth (m)	Actual coordinates		Target coordinates		Offset from target				Surveyor	Remarks
								Easting	Northing	Easting	Northing	dE	dN	Range	Bearing

APPENDIX A FIELD SAMPLING LOGS

Gardline — Seafloor Sampling Positioning Summary

Job No	54027			Vessel	*Ocean Geograph*						
Client	Morven Offshore Wind Limited			Vessel Reference Point (VRP)	COG						
Project Name	Morven ECR			Deployment Location	Environmental A frame	x	9.31	y	-14.81	z	5.97
Primary Positioning System	StarPack1			Actual Coordinates derived from	Beacon						
Geodetic Reference System	Datum	WGS 84 (18) to ED50	Ellipsoid	International 1924	Projection	UTM zone 30N			Vertical / Tidal Datum	LAT	

Date	Time (UTC/GMT)	Fix number	Stn No	Penetration	Sample Retention	Retention	Observed Seafloor Depth (m)	Actual coordinates		Target coordinates		Offset from target				Surveyor	Remarks
								Easting	Northing	Easting	Northing	dE	dN	Range	Bearing

APPENDIX A FIELD SAMPLING LOGS

Gardline — Seafloor Sampling Positioning Summary

Job No	54027			Vessel	*Ocean Geograph*						
Client	Morven Offshore Wind Limited			Vessel Reference Point (VRP)	COG						
Project Name	Morven ECR			Deployment Location	Environmental A frame	x	9.31	y	-14.81	z	5.97
Primary Positioning System	StarPack1			Actual Coordinates derived from	Beacon						
Geodetic Reference System	Datum	WGS 84 (18) to ED50	Ellipsoid	International 1924	Projection	UTM zone 30N			Vertical / Tidal Datum	LAT	

Date	Time (UTC/GMT)	Fix number	Stn No	Penetration	Sample Retention	Retention	Observed Seafloor Depth (m)	Actual coordinates		Target coordinates		Offset from target				Surveyor	Remarks
								Easting	Northing	Easting	Northing	dE	dN	Range	Bearing

APPENDIX A FIELD SAMPLING LOGS

Gardline — Seafloor Sampling Positioning Summary

Job No	54027			Vessel	*Ocean Geograph*						
Client	Morven Offshore Wind Limited			Vessel Reference Point (VRP)	COG						
Project Name	Morven ECR			Deployment Location	Environmental A frame	x	9.31	y	-14.81	z	5.97
Primary Positioning System	StarPack1			Actual Coordinates derived from	Beacon						
Geodetic Reference System	Datum	WGS 84 (18) to ED50	Ellipsoid	International 1924	Projection	UTM zone 30N			Vertical / Tidal Datum	LAT	

Date	Time (UTC/GMT)	Fix number	Stn No	Penetration	Sample Retention	Retention	Observed Seafloor Depth (m)	Actual coordinates		Target coordinates		Offset from target				Surveyor	Remarks
								Easting	Northing	Easting	Northing	dE	dN	Range	Bearing

APPENDIX A FIELD SAMPLING LOGS

Gardline — Seafloor Sampling Positioning Summary

Job No	54027			Vessel	*Ocean Geograph*						
Client	Morven Offshore Wind Limited			Vessel Reference Point (VRP)	COG						
Project Name	Morven ECR			Deployment Location	Environmental A frame	x	9.31	y	-14.81	z	5.97
Primary Positioning System	StarPack1			Actual Coordinates derived from	Beacon						
Geodetic Reference System	Datum	WGS 84 (18) to ED50	Ellipsoid	International 1924	Projection	UTM zone 30N			Vertical / Tidal Datum	LAT	

Date	Time (UTC/GMT)	Fix number	Stn No	Penetration	Sample Retention	Retention	Observed Seafloor Depth (m)	Actual coordinates		Target coordinates		Offset from target				Surveyor	Remarks
								Easting	Northing	Easting	Northing	dE	dN	Range	Bearing

APPENDIX A FIELD SAMPLING LOGS

Gardline — Seafloor Sampling Positioning Summary

Job No	54027			Vessel	*Ocean Geograph*						
Client	Morven Offshore Wind Limited			Vessel Reference Point (VRP)	COG						
Project Name	Morven ECR			Deployment Location	Environmental A frame	x	9.31	y	-14.81	z	5.97
Primary Positioning System	StarPack1			Actual Coordinates derived from	Beacon						
Geodetic Reference System	Datum	WGS 84 (18) to ED50	Ellipsoid	International 1924	Projection	UTM zone 30N			Vertical / Tidal Datum	LAT	

Date	Time (UTC/GMT)	Fix number	Stn No	Penetration	Sample Retention	Retention	Observed Seafloor Depth (m)	Actual coordinates		Target coordinates		Offset from target				Surveyor	Remarks
								Easting	Northing	Easting	Northing	dE	dN	Range	Bearing

APPENDIX A FIELD SAMPLING LOGS

Gardline — Seafloor Sampling Positioning Summary

Job No	54027			Vessel	*Ocean Geograph*						
Client	Morven Offshore Wind Limited			Vessel Reference Point (VRP)	COG						
Project Name	Morven ECR			Deployment Location	Environmental A frame	x	9.31	y	-14.81	z	5.97
Primary Positioning System	StarPack1			Actual Coordinates derived from	Beacon						
Geodetic Reference System	Datum	WGS 84 (18) to ED50	Ellipsoid	International 1924	Projection	UTM zone 30N		Vertical / Tidal Datum	LAT		

Date	Time (UTC/GMT)	Fix number	Stn No	Penetration	Sample Retention	Retention	Observed Seafloor Depth (m)	Actual coordinates		Target coordinates		Offset from target				Surveyor	Remarks
								Easting	Northing	Easting	Northing	dE	dN	Range	Bearing

APPENDIX A FIELD SAMPLING LOGS

Gardline — Seafloor Sampling Positioning Summary

Job No	54027			Vessel	*Ocean Geograph*						
Client	Morven Offshore Wind Limited			Vessel Reference Point (VRP)	COG						
Project Name	Morven ECR			Deployment Location	Environmental A frame	x	9.31	y	-14.81	z	5.97
Primary Positioning System	StarPack1			Actual Coordinates derived from	Beacon						
Geodetic Reference System	Datum	WGS 84 (18) to ED50	Ellipsoid	International 1924	Projection	UTM zone 30N			Vertical / Tidal Datum	LAT	

Date	Time (UTC/GMT)	Fix number	Stn No	Penetration	Sample Retention	Retention	Observed Seafloor Depth (m)	Actual coordinates		Target coordinates		Offset from target				Surveyor	Remarks
								Easting	Northing	Easting	Northing	dE	dN	Range	Bearing

APPENDIX A FIELD SAMPLING LOGS

Gardline — Seafloor Sampling Positioning Summary

Job No	54027			Vessel	*Ocean Geograph*						
Client	Morven Offshore Wind Limited			Vessel Reference Point (VRP)	COG						
Project Name	Morven ECR			Deployment Location	Environmental A frame	x	9.31	y	-14.81	z	5.97
Primary Positioning System	StarPack1			Actual Coordinates derived from	Beacon						
Geodetic Reference System	Datum	WGS 84 (18) to ED50	Ellipsoid	International 1924	Projection	UTM zone 30N			Vertical / Tidal Datum	LAT	

Date	Time (UTC/GMT)	Fix number	Stn No	Penetration	Sample Retention	Retention	Observed Seafloor Depth (m)	Actual coordinates		Target coordinates		Offset from target				Surveyor	Remarks
								Easting	Northing	Easting	Northing	dE	dN	Range	Bearing

APPENDIX A FIELD SAMPLING LOGS

Gardline — Seafloor Sampling Positioning Summary

Job No	54027			Vessel	*Ocean Geograph*						
Client	Morven Offshore Wind Limited			Vessel Reference Point (VRP)	COG						
Project Name	Morven ECR			Deployment Location	Environmental A frame	x	9.31	y	-14.81	z	5.97
Primary Positioning System	StarPack1			Actual Coordinates derived from	Beacon						
Geodetic Reference System	Datum	WGS 84 (18) to ED50	Ellipsoid	International 1924	Projection	UTM zone 30N			Vertical / Tidal Datum	LAT

APPENDIX A FIELD SAMPLING LOGS

Gardline — Seafloor Sampling Positioning Summary

Job No	54027			Vessel	*Ocean Geograph*						
Client	Morven Offshore Wind Limited			Vessel Reference Point (VRP)	COG						
Project Name	Morven ECR			Deployment Location	Environmental A frame	x	9.31	y	-14.81	z	5.97
Primary Positioning System	StarPack1			Actual Coordinates derived from	Beacon						
Geodetic Reference System	Datum	WGS 84 (18) to ED50	Ellipsoid	International 1924	Projection	UTM zone 30N			Vertical / Tidal Datum	LAT	

Date	Time (UTC/GMT)	Fix number	Stn No	Penetration	Sample Retention	Retention	Observed Seafloor Depth (m)	Actual coordinates		Target coordinates		Offset from target				Surveyor	Remarks
								Easting	Northing	Easting	Northing	dE	dN	Range	Bearing

APPENDIX A FIELD SAMPLING LOGS

Gardline — Seafloor Sampling Positioning Summary

Job No	54027			Vessel	*Ocean Geograph*						
Client	Morven Offshore Wind Limited			Vessel Reference Point (VRP)	COG						
Project Name	Morven ECR			Deployment Location	Environmental A frame	x	9.31	y	-14.81	z	5.97
Primary Positioning System	StarPack1			Actual Coordinates derived from	Beacon						
Geodetic Reference System	Datum	WGS 84 (18) to ED50	Ellipsoid	International 1924	Projection	UTM zone 30N		Vertical / Tidal Datum	LAT		

Date	Time (UTC/GMT)	Fix number	Stn No	Penetration	Sample Retention	Retention	Observed Seafloor Depth (m)	Actual coordinates		Target coordinates		Offset from target				Surveyor	Remarks
								Easting	Northing	Easting	Northing	dE	dN	Range	Bearing

APPENDIX A FIELD SAMPLING LOGS

Gardline — Seafloor Sampling Positioning Summary

Job No	54027			Vessel	*Ocean Geograph*						
Client	Morven Offshore Wind Limited			Vessel Reference Point (VRP)	COG						
Project Name	Morven ECR			Deployment Location	Environmental A frame	x	9.31	y	-14.81	z	5.97
Primary Positioning System	StarPack1			Actual Coordinates derived from	Beacon						
Geodetic Reference System	Datum	WGS 84 (18) to ED50	Ellipsoid	International 1924	Projection	UTM zone 30N			Vertical / Tidal Datum	LAT	

Date	Time (UTC/GMT)	Fix number	Stn No	Penetration	Sample Retention	Retention	Observed Seafloor Depth (m)	Actual coordinates		Target coordinates		Offset from target				Surveyor	Remarks
								Easting	Northing	Easting	Northing	dE	dN	Range	Bearing

APPENDIX A FIELD SAMPLING LOGS

Gardline — Seafloor Sampling Positioning Summary

Job No	54027			Vessel	*Ocean Geograph*						
Client	Morven Offshore Wind Limited			Vessel Reference Point (VRP)	COG						
Project Name	Morven ECR			Deployment Location	Environmental A frame	x	9.31	y	-14.81	z	5.97
Primary Positioning System	StarPack1			Actual Coordinates derived from	Beacon						
Geodetic Reference System	Datum	WGS 84 (18) to ED50	Ellipsoid	International 1924	Projection	UTM zone 30N			Vertical / Tidal Datum	LAT	

Date	Time (UTC/GMT)	Fix number	Stn No	Penetration	Sample Retention	Retention	Observed Seafloor Depth (m)	Actual coordinates		Target coordinates		Offset from target				Surveyor	Remarks
								Easting	Northing	Easting	Northing	dE	dN	Range	Bearing

APPENDIX A FIELD SAMPLING LOGS

Gardline — Seafloor Sampling Positioning Summary

Job No	54027			Vessel	*Ocean Geograph*						
Client	Morven Offshore Wind Limited			Vessel Reference Point (VRP)	COG						
Project Name	Morven ECR			Deployment Location	Environmental A frame	x	9.31	y	-14.81	z	5.97
Primary Positioning System	StarPack1			Actual Coordinates derived from	Beacon						
Geodetic Reference System	Datum	WGS 84 (18) to ED50	Ellipsoid	International 1924	Projection	UTM zone 30N			Vertical / Tidal Datum	LAT	

Date	Time (UTC/GMT)	Fix number	Stn No	Penetration	Sample Retention	Retention	Observed Seafloor Depth (m)	Actual coordinates		Target coordinates		Offset from target				Surveyor	Remarks
								Easting	Northing	Easting	Northing	dE	dN	Range	Bearing

APPENDIX A FIELD SAMPLING LOGS

Gardline — Seafloor Sampling Positioning Summary

Job No	54027			Vessel	*Ocean Geograph*						
Client	Morven Offshore Wind Limited			Vessel Reference Point (VRP)	COG						
Project Name	Morven ECR			Deployment Location	Environmental A frame	x	9.31	y	-14.81	z	5.97
Primary Positioning System	StarPack1			Actual Coordinates derived from	Beacon						
Geodetic Reference System	Datum	WGS 84 (18) to ED50	Ellipsoid	International 1924	Projection	UTM zone 30N			Vertical / Tidal Datum	LAT	

Date	Time (UTC/GMT)	Fix number	Stn No	Penetration	Sample Retention	Retention	Observed Seafloor Depth (m)	Actual coordinates		Target coordinates		Offset from target				Surveyor	Remarks
								Easting	Northing	Easting	Northing	dE	dN	Range	Bearing

APPENDIX A FIELD SAMPLING LOGS

Seafloor Sampling Positioning Summary

Job No	54027			Vessel	*Ocean Geograph*						
Client	Morven Offshore Wind Limited			Vessel Reference Point (VRP)	COG						
Project Name	Morven ECR			Deployment Location	Environmental A frame	x	9.31	y	-14.81	z	5.97
Primary Positioning System	StarPack1			Actual Coordinates derived from	Beacon						
Geodetic Reference System	Datum	WGS 84 (18) to ED50	Ellipsoid	International 1924	Projection	UTM zone 30N			Vertical / Tidal Datum	LAT	

Date	Time (UTC/GMT)	Fix number	Stn No	Penetration	Sample Retention	Retention	Observed Seafloor Depth (m)	Actual coordinates		Target coordinates		Offset from target				Surveyor	Remarks
								Easting	Northing	Easting	Northing	dE	dN	Range	Bearing

APPENDIX A FIELD SAMPLING LOGS

Gardline — Seafloor Sampling Positioning Summary

Job No	54027			Vessel	*Ocean Geograph*						
Client	Morven Offshore Wind Limited			Vessel Reference Point (VRP)	COG						
Project Name	Morven ECR			Deployment Location	Environmental A frame	x	9.31	y	-14.81	z	5.97
Primary Positioning System	StarPack1			Actual Coordinates derived from	Beacon						
Geodetic Reference System	Datum	WGS 84 (18) to ED50	Ellipsoid	International 1924	Projection	UTM zone 30N			Vertical / Tidal Datum	LAT	

Date	Time (UTC/GMT)	Fix number	Stn No	Penetration	Sample Retention	Retention	Observed Seafloor Depth (m)	Actual coordinates		Target coordinates		Offset from target				Surveyor	Remarks
								Easting	Northing	Easting	Northing	dE	dN	Range	Bearing

APPENDIX A FIELD SAMPLING LOGS

Gardline — Seafloor Sampling Positioning Summary

Job No	54027			Vessel	*Ocean Geograph*						
Client	Morven Offshore Wind Limited			Vessel Reference Point (VRP)	COG						
Project Name	Morven ECR			Deployment Location	Environmental A frame	x	9.31	y	-14.81	z	5.97
Primary Positioning System	StarPack1			Actual Coordinates derived from	Beacon						
Geodetic Reference System	Datum	WGS 84 (18) to ED50	Ellipsoid	International 1924	Projection	UTM zone 30N			Vertical / Tidal Datum	LAT	

Date	Time (UTC/GMT)	Fix number	Stn No	Penetration	Sample Retention	Retention	Observed Seafloor Depth (m)	Actual coordinates		Target coordinates		Offset from target				Surveyor	Remarks
								Easting	Northing	Easting	Northing	dE	dN	Range	Bearing

APPENDIX A FIELD SAMPLING LOGS

Gardline — Seafloor Sampling Positioning Summary

Job No	54027			Vessel	*Ocean Geograph*						
Client	Morven Offshore Wind Limited			Vessel Reference Point (VRP)	COG						
Project Name	Morven ECR			Deployment Location	Environmental A frame	x	9.31	y	-14.81	z	5.97
Primary Positioning System	StarPack1			Actual Coordinates derived from	Beacon						
Geodetic Reference System	Datum	WGS 84 (18) to ED50	Ellipsoid	International 1924	Projection	UTM zone 30N			Vertical / Tidal Datum	LAT	

Date	Time (UTC/GMT)	Fix number	Stn No	Penetration	Sample Retention	Retention	Observed Seafloor Depth (m)	Actual coordinates		Target coordinates		Offset from target				Surveyor	Remarks
								Easting	Northing	Easting	Northing	dE	dN	Range	Bearing

APPENDIX A FIELD SAMPLING LOGS

Gardline — Seafloor Sampling Positioning Summary

Job No	54027			Vessel	*Ocean Geograph*						
Client	Morven Offshore Wind Limited			Vessel Reference Point (VRP)	COG						
Project Name	Morven ECR			Deployment Location	Environmental A frame	x	9.31	y	-14.81	z	5.97
Primary Positioning System	StarPack1			Actual Coordinates derived from	Beacon						
Geodetic Reference System	Datum	WGS 84 (18) to ED50	Ellipsoid	International 1924	Projection	UTM zone 30N			Vertical / Tidal Datum	LAT	

Date	Time (UTC/GMT)	Fix number	Stn No	Penetration	Sample Retention	Retention	Observed Seafloor Depth (m)	Actual coordinates		Target coordinates		Offset from target				Surveyor	Remarks
								Easting	Northing	Easting	Northing	dE	dN	Range	Bearing

APPENDIX A FIELD SAMPLING LOGS

Gardline — Seafloor Sampling Positioning Summary

Job No	54027			Vessel	*Ocean Geograph*						
Client	Morven Offshore Wind Limited			Vessel Reference Point (VRP)	COG						
Project Name	Morven ECR			Deployment Location	Environmental A frame	x	9.31	y	-14.81	z	5.97
Primary Positioning System	StarPack1			Actual Coordinates derived from	Beacon						
Geodetic Reference System	Datum	WGS 84 (18) to ED50	Ellipsoid	International 1924	Projection	UTM zone 30N			Vertical / Tidal Datum	LAT	

Date	Time (UTC/GMT)	Fix number	Stn No	Penetration	Sample Retention	Retention	Observed Seafloor Depth (m)	Actual coordinates		Target coordinates		Offset from target				Surveyor	Remarks
								Easting	Northing	Easting	Northing	dE	dN	Range	Bearing

APPENDIX A FIELD SAMPLING LOGS

Gardline — Seafloor Sampling Positioning Summary

Job No	54027			Vessel	*Ocean Geograph*						
Client	Morven Offshore Wind Limited			Vessel Reference Point (VRP)	COG						
Project Name	Morven ECR			Deployment Location	Environmental A frame	x	9.31	y	-14.81	z	5.97
Primary Positioning System	StarPack1			Actual Coordinates derived from	Beacon						
Geodetic Reference System	Datum	WGS 84 (18) to ED50	Ellipsoid	International 1924	Projection	UTM zone 30N			Vertical / Tidal Datum	LAT	

Date	Time (UTC/GMT)	Fix number	Stn No	Penetration	Sample Retention	Retention	Observed Seafloor Depth (m)	Actual coordinates		Target coordinates		Offset from target				Surveyor	Remarks
								Easting	Northing	Easting	Northing	dE	dN	Range	Bearing

APPENDIX A FIELD SAMPLING LOGS

Gardline — Seafloor Sampling Positioning Summary

Job No	54027			Vessel	*Ocean Geograph*						
Client	Morven Offshore Wind Limited			Vessel Reference Point (VRP)	COG						
Project Name	Morven ECR			Deployment Location	Environmental A frame	x	9.31	y	-14.81	z	5.97
Primary Positioning System	StarPack1			Actual Coordinates derived from	Beacon						
Geodetic Reference System	Datum	WGS 84 (18) to ED50	Ellipsoid	International 1924	Projection	UTM zone 30N			Vertical / Tidal Datum	LAT	

Date	Time (UTC/GMT)	Fix number	Stn No	Penetration	Sample Retention	Retention	Observed Seafloor Depth (m)	Actual coordinates		Target coordinates		Offset from target				Surveyor	Remarks
								Easting	Northing	Easting	Northing	dE	dN	Range	Bearing

APPENDIX A FIELD SAMPLING LOGS

Seafloor Sampling Positioning Summary

Job No	54027			Vessel	*Ocean Geograph*						
Client	Morven Offshore Wind Limited			Vessel Reference Point (VRP)	COG						
Project Name	Morven ECR			Deployment Location	Environmental A frame	x	9.31	y	-14.81	z	5.97
Primary Positioning System	StarPack1			Actual Coordinates derived from	Beacon						
Geodetic Reference System	Datum	WGS 84 (18) to ED50	Ellipsoid	International 1924	Projection	UTM zone 30N			Vertical / Tidal Datum	LAT	

Date	Time (UTC/GMT)	Fix number	Stn No	Penetration	Sample Retention	Retention	Observed Seafloor Depth (m)	Actual coordinates		Target coordinates		Offset from target				Surveyor	Remarks
								Easting	Northing	Easting	Northing	dE	dN	Range	Bearing

APPENDIX A FIELD SAMPLING LOGS

Gardline — Seafloor Sampling Positioning Summary

Job No	54027			Vessel	*Ocean Geograph*						
Client	Morven Offshore Wind Limited			Vessel Reference Point (VRP)	COG						
Project Name	Morven ECR			Deployment Location	Environmental A frame	x	9.31	y	-14.81	z	5.97
Primary Positioning System	StarPack1			Actual Coordinates derived from	Beacon						
Geodetic Reference System	Datum	WGS 84 (18) to ED50	Ellipsoid	International 1924	Projection	UTM zone 30N			Vertical / Tidal Datum	LAT	

Date	Time (UTC/GMT)	Fix number	Stn No	Penetration	Sample Retention	Retention	Observed Seafloor Depth (m)	Actual coordinates		Target coordinates		Offset from target				Surveyor	Remarks
								Easting	Northing	Easting	Northing	dE	dN	Range	Bearing

APPENDIX A FIELD SAMPLING LOGS

Gardline — Seafloor Sampling Positioning Summary

Job No	54027			Vessel	*Ocean Geograph*						
Client	Morven Offshore Wind Limited			Vessel Reference Point (VRP)	COG						
Project Name	Morven ECR			Deployment Location	Environmental A frame	x	9.31	y	-14.81	z	5.97
Primary Positioning System	StarPack1			Actual Coordinates derived from	Beacon						
Geodetic Reference System	Datum	WGS 84 (18) to ED50	Ellipsoid	International 1924	Projection	UTM zone 30N			Vertical / Tidal Datum	LAT	

Date	Time (UTC/GMT)	Fix number	Stn No	Penetration	Sample Retention	Retention	Observed Seafloor Depth (m)	Actual coordinates		Target coordinates		Offset from target				Surveyor	Remarks
								Easting	Northing	Easting	Northing	dE	dN	Range	Bearing

APPENDIX A FIELD SAMPLING LOGS

Gardline — Seafloor Sampling Positioning Summary

Job No	54027			Vessel	*Ocean Geograph*						
Client	Morven Offshore Wind Limited			Vessel Reference Point (VRP)	COG						
Project Name	Morven ECR			Deployment Location	Environmental A frame	x	9.31	y	-14.81	z	5.97
Primary Positioning System	StarPack1			Actual Coordinates derived from	Beacon						
Geodetic Reference System	Datum	WGS 84 (18) to ED50	Ellipsoid	International 1924	Projection	UTM zone 30N			Vertical / Tidal Datum	LAT	

Date	Time (UTC/GMT)	Fix number	Stn No	Penetration	Sample Retention	Retention	Observed Seafloor Depth (m)	Actual coordinates		Target coordinates		Offset from target				Surveyor	Remarks
								Easting	Northing	Easting	Northing	dE	dN	Range	Bearing

APPENDIX A FIELD SAMPLING LOGS

Gardline — Seafloor Sampling Positioning Summary

Job No	54027			Vessel	*Ocean Geograph*						
Client	Morven Offshore Wind Limited			Vessel Reference Point (VRP)	COG						
Project Name	Morven ECR			Deployment Location	Environmental A frame	x	9.31	y	-14.81	z	5.97
Primary Positioning System	StarPack1			Actual Coordinates derived from	Beacon						
Geodetic Reference System	Datum	WGS 84 (18) to ED50	Ellipsoid	International 1924	Projection	UTM zone 30N			Vertical / Tidal Datum	LAT	

Date	Time (UTC/GMT)	Fix number	Stn No	Penetration	Sample Retention	Retention	Observed Seafloor Depth (m)	Actual coordinates		Target coordinates		Offset from target				Surveyor	Remarks
								Easting	Northing	Easting	Northing	dE	dN	Range	Bearing

APPENDIX A FIELD SAMPLING LOGS

Gardline — Seafloor Sampling Positioning Summary

Job No	54027			Vessel	*Ocean Geograph*						
Client	Morven Offshore Wind Limited			Vessel Reference Point (VRP)	COG						
Project Name	Morven ECR			Deployment Location	Environmental A frame	x	9.31	y	-14.81	z	5.97
Primary Positioning System	StarPack1			Actual Coordinates derived from	Beacon						
Geodetic Reference System	Datum	WGS 84 (18) to ED50	Ellipsoid	International 1924	Projection	UTM zone 30N			Vertical / Tidal Datum	LAT	

Date	Time (UTC/GMT)	Fix number	Stn No	Penetration	Sample Retention	Retention	Observed Seafloor Depth (m)	Actual coordinates		Target coordinates		Offset from target				Surveyor	Remarks
								Easting	Northing	Easting	Northing	dE	dN	Range	Bearing

APPENDIX A FIELD SAMPLING LOGS

Gardline — Seafloor Sampling Positioning Summary

Job No	54027			Vessel	*Ocean Geograph*						
Client	Morven Offshore Wind Limited			Vessel Reference Point (VRP)	COG						
Project Name	Morven ECR			Deployment Location	Environmental A frame	x	9.31	y	-14.81	z	5.97
Primary Positioning System	StarPack1			Actual Coordinates derived from	Beacon						
Geodetic Reference System	Datum	WGS 84 (18) to ED50	Ellipsoid	International 1924	Projection	UTM zone 30N			Vertical / Tidal Datum	LAT	

Date	Time (UTC/GMT)	Fix number	Stn No	Penetration	Sample Retention	Retention	Observed Seafloor Depth (m)	Actual coordinates		Target coordinates		Offset from target				Surveyor	Remarks
								Easting	Northing	Easting	Northing	dE	dN	Range	Bearing

APPENDIX A FIELD SAMPLING LOGS

Gardline — Seafloor Sampling Positioning Summary

Job No	54027			Vessel	*Ocean Geograph*						
Client	Morven Offshore Wind Limited			Vessel Reference Point (VRP)	COG						
Project Name	Morven ECR			Deployment Location	Environmental A frame	x	9.31	y	-14.81	z	5.97
Primary Positioning System	StarPack1			Actual Coordinates derived from	Beacon						
Geodetic Reference System	Datum	WGS 84 (18) to ED50	Ellipsoid	International 1924	Projection	UTM zone 30N			Vertical / Tidal Datum	LAT	

Date	Time (UTC/GMT)	Fix number	Stn No	Penetration	Sample Retention	Retention	Observed Seafloor Depth (m)	Actual coordinates		Target coordinates		Offset from target				Surveyor	Remarks
								Easting	Northing	Easting	Northing	dE	dN	Range	Bearing

APPENDIX A FIELD SAMPLING LOGS

Gardline — Seafloor Sampling Positioning Summary

Job No	54027			Vessel	*Ocean Geograph*						
Client	Morven Offshore Wind Limited			Vessel Reference Point (VRP)	COG						
Project Name	Morven ECR			Deployment Location	Environmental A frame	x	9.31	y	-14.81	z	5.97
Primary Positioning System	StarPack1			Actual Coordinates derived from	Beacon						
Geodetic Reference System	Datum	WGS 84 (18) to ED50	Ellipsoid	International 1924	Projection	UTM zone 30N			Vertical / Tidal Datum	LAT	

Date	Time (UTC/GMT)	Fix number	Stn No	Penetration	Sample Retention	Retention	Observed Seafloor Depth (m)	Actual coordinates		Target coordinates		Offset from target				Surveyor	Remarks
								Easting	Northing	Easting	Northing	dE	dN	Range	Bearing

APPENDIX A FIELD SAMPLING LOGS

Gardline — Seafloor Sampling Positioning Summary

Job No	54027			Vessel	*Ocean Geograph*						
Client	Morven Offshore Wind Limited			Vessel Reference Point (VRP)	COG						
Project Name	Morven ECR			Deployment Location	Environmental A frame	x	9.31	y	-14.81	z	5.97
Primary Positioning System	StarPack1			Actual Coordinates derived from	Beacon						
Geodetic Reference System	Datum	WGS 84 (18) to ED50	Ellipsoid	International 1924	Projection	UTM zone 30N			Vertical / Tidal Datum	LAT	

Date	Time (UTC/GMT)	Fix number	Stn No	Penetration	Sample Retention	Retention	Observed Seafloor Depth (m)	Actual coordinates		Target coordinates		Offset from target				Surveyor	Remarks
								Easting	Northing	Easting	Northing	dE	dN	Range	Bearing

APPENDIX A FIELD SAMPLING LOGS

Gardline — Seafloor Sampling Positioning Summary

Job No	54027			Vessel	*Ocean Geograph*						
Client	Morven Offshore Wind Limited			Vessel Reference Point (VRP)	COG						
Project Name	Morven ECR			Deployment Location	Environmental A frame	x	9.31	y	-14.81	z	5.97
Primary Positioning System	StarPack1			Actual Coordinates derived from	Beacon						
Geodetic Reference System	Datum	WGS 84 (18) to ED50	Ellipsoid	International 1924	Projection	UTM zone 30N			Vertical / Tidal Datum	LAT	

Date	Time (UTC/GMT)	Fix number	Stn No	Penetration	Sample Retention	Retention	Observed Seafloor Depth (m)	Actual coordinates		Target coordinates		Offset from target				Surveyor	Remarks
								Easting	Northing	Easting	Northing	dE	dN	Range	Bearing

APPENDIX A FIELD SAMPLING LOGS

Gardline — Seafloor Sampling Positioning Summary

Job No	54027			Vessel	*Ocean Geograph*						
Client	Morven Offshore Wind Limited			Vessel Reference Point (VRP)	COG						
Project Name	Morven ECR			Deployment Location	Environmental A frame	x	9.31	y	-14.81	z	5.97
Primary Positioning System	StarPack1			Actual Coordinates derived from	Beacon						
Geodetic Reference System	Datum	WGS 84 (18) to ED50	Ellipsoid	International 1924	Projection	UTM zone 30N			Vertical / Tidal Datum	LAT	

Date	Time (UTC/GMT)	Fix number	Stn No	Penetration	Sample Retention	Retention	Observed Seafloor Depth (m)	Actual coordinates		Target coordinates		Offset from target				Surveyor	Remarks
								Easting	Northing	Easting	Northing	dE	dN	Range	Bearing

APPENDIX A FIELD SAMPLING LOGS

Gardline — Seafloor Sampling Positioning Summary

Job No	54027			Vessel	*Ocean Geograph*						
Client	Morven Offshore Wind Limited			Vessel Reference Point (VRP)	COG						
Project Name	Morven ECR			Deployment Location	Environmental A frame	x	9.31	y	-14.81	z	5.97
Primary Positioning System	StarPack1			Actual Coordinates derived from	Beacon						
Geodetic Reference System	Datum	WGS 84 (18) to ED50	Ellipsoid	International 1924	Projection	UTM zone 30N			Vertical / Tidal Datum	LAT	

Date	Time (UTC/GMT)	Fix number	Stn No	Penetration	Sample Retention	Retention	Observed Seafloor Depth (m)	Actual coordinates		Target coordinates		Offset from target				Surveyor	Remarks
								Easting	Northing	Easting	Northing	dE	dN	Range	Bearing

APPENDIX A FIELD SAMPLING LOGS

Gardline — Seafloor Sampling Positioning Summary

Job No	54027			Vessel	*Ocean Geograph*						
Client	Morven Offshore Wind Limited			Vessel Reference Point (VRP)	COG						
Project Name	Morven ECR			Deployment Location	Environmental A frame	x	9.31	y	-14.81	z	5.97
Primary Positioning System	StarPack1			Actual Coordinates derived from	Beacon						
Geodetic Reference System	Datum	WGS 84 (18) to ED50	Ellipsoid	International 1924	Projection	UTM zone 30N		Vertical / Tidal Datum	LAT		

Date	Time (UTC/GMT)	Fix number	Stn No	Penetration	Sample Retention	Retention	Observed Seafloor Depth (m)	Actual coordinates		Target coordinates		Offset from target				Surveyor	Remarks
								Easting	Northing	Easting	Northing	dE	dN	Range	Bearing

APPENDIX A FIELD SAMPLING LOGS

Gardline — Seafloor Sampling Positioning Summary

Job No	54027			Vessel	*Ocean Geograph*						
Client	Morven Offshore Wind Limited			Vessel Reference Point (VRP)	COG						
Project Name	Morven ECR			Deployment Location	Environmental A frame	x	9.31	y	-14.81	z	5.97
Primary Positioning System	StarPack1			Actual Coordinates derived from	Beacon						
Geodetic Reference System	Datum	WGS 84 (18) to ED50	Ellipsoid	International 1924	Projection	UTM zone 30N			Vertical / Tidal Datum	LAT	

Date	Time (UTC/GMT)	Fix number	Stn No	Penetration	Sample Retention	Retention	Observed Seafloor Depth (m)	Actual coordinates		Target coordinates		Offset from target				Surveyor	Remarks
								Easting	Northing	Easting	Northing	dE	dN	Range	Bearing

APPENDIX A FIELD SAMPLING LOGS

Gardline — Seafloor Sampling Positioning Summary

Job No	54027			Vessel	*Ocean Geograph*						
Client	Morven Offshore Wind Limited			Vessel Reference Point (VRP)	COG						
Project Name	Morven ECR			Deployment Location	Environmental A frame	x	9.31	y	-14.81	z	5.97
Primary Positioning System	StarPack1			Actual Coordinates derived from	Beacon						
Geodetic Reference System	Datum	WGS 84 (18) to ED50	Ellipsoid	International 1924	Projection	UTM zone 30N			Vertical / Tidal Datum	LAT	

Date	Time (UTC/GMT)	Fix number	Stn No	Penetration	Sample Retention	Retention	Observed Seafloor Depth (m)	Actual coordinates		Target coordinates		Offset from target				Surveyor	Remarks
								Easting	Northing	Easting	Northing	dE	dN	Range	Bearing

APPENDIX A FIELD SAMPLING LOGS

Gardline — Seafloor Sampling Positioning Summary

Job No	54027			Vessel	*Ocean Geograph*						
Client	Morven Offshore Wind Limited			Vessel Reference Point (VRP)	COG						
Project Name	Morven ECR			Deployment Location	Environmental A frame	x	9.31	y	-14.81	z	5.97
Primary Positioning System	StarPack1			Actual Coordinates derived from	Beacon						
Geodetic Reference System	Datum	WGS 84 (18) to ED50	Ellipsoid	International 1924	Projection	UTM zone 30N		Vertical / Tidal Datum	LAT		

Date	Time (UTC/GMT)	Fix number	Stn No	Penetration	Sample Retention	Retention	Observed Seafloor Depth (m)	Actual coordinates		Target coordinates		Offset from target				Surveyor	Remarks
								Easting	Northing	Easting	Northing	dE	dN	Range	Bearing

APPENDIX A FIELD SAMPLING LOGS

Gardline — Seafloor Sampling Positioning Summary

Job No	54027			Vessel	*Ocean Geograph*						
Client	Morven Offshore Wind Limited			Vessel Reference Point (VRP)	COG						
Project Name	Morven ECR			Deployment Location	Environmental A frame	x	9.31	y	-14.81	z	5.97
Primary Positioning System	StarPack1			Actual Coordinates derived from	Beacon						
Geodetic Reference System	Datum	WGS 84 (18) to ED50	Ellipsoid	International 1924	Projection	UTM zone 30N		Vertical / Tidal Datum	LAT		

Date	Time (UTC/GMT)	Fix number	Stn No	Penetration	Sample Retention	Retention	Observed Seafloor Depth (m)	Actual coordinates		Target coordinates		Offset from target				Surveyor	Remarks
								Easting	Northing	Easting	Northing	dE	dN	Range	Bearing

APPENDIX A FIELD SAMPLING LOGS

Gardline — Seafloor Sampling Positioning Summary

Job No	54027			Vessel	*Ocean Geograph*						
Client	Morven Offshore Wind Limited			Vessel Reference Point (VRP)	COG						
Project Name	Morven ECR			Deployment Location	Environmental A frame	x	9.31	y	-14.81	z	5.97
Primary Positioning System	StarPack1			Actual Coordinates derived from	Beacon						
Geodetic Reference System	Datum	WGS 84 (18) to ED50	Ellipsoid	International 1924	Projection	UTM zone 30N			Vertical / Tidal Datum	LAT	

Date	Time (UTC/GMT)	Fix number	Stn No	Penetration	Sample Retention	Retention	Observed Seafloor Depth (m)	Actual coordinates		Target coordinates		Offset from target				Surveyor	Remarks
								Easting	Northing	Easting	Northing	dE	dN	Range	Bearing

APPENDIX A FIELD SAMPLING LOGS

Gardline — Seafloor Sampling Positioning Summary

Job No	54027			Vessel	*Ocean Geograph*						
Client	Morven Offshore Wind Limited			Vessel Reference Point (VRP)	COG						
Project Name	Morven ECR			Deployment Location	Environmental A frame	x	9.31	y	-14.81	z	5.97
Primary Positioning System	StarPack1			Actual Coordinates derived from	Beacon						
Geodetic Reference System	Datum	WGS 84 (18) to ED50	Ellipsoid	International 1924	Projection	UTM zone 30N		Vertical / Tidal Datum	LAT

APPENDIX A FIELD SAMPLING LOGS

Gardline — Seafloor Sampling Positioning Summary

Job No	54027			Vessel	*Ocean Geograph*						
Client	Morven Offshore Wind Limited			Vessel Reference Point (VRP)	COG						
Project Name	Morven ECR			Deployment Location	Environmental A frame	x	9.31	y	-14.81	z	5.97
Primary Positioning System	StarPack1			Actual Coordinates derived from	Beacon						
Geodetic Reference System	Datum	WGS 84 (18) to ED50	Ellipsoid	International 1924	Projection	UTM zone 30N			Vertical / Tidal Datum	LAT	

Date	Time (UTC/GMT)	Fix number	Stn No	Penetration	Sample Retention	Retention	Observed Seafloor Depth (m)	Actual coordinates		Target coordinates		Offset from target				Surveyor	Remarks
								Easting	Northing	Easting	Northing	dE	dN	Range	Bearing

APPENDIX A FIELD SAMPLING LOGS

Gardline — Seafloor Sampling Positioning Summary

Job No	54027			Vessel	*Ocean Geograph*						
Client	Morven Offshore Wind Limited			Vessel Reference Point (VRP)	COG						
Project Name	Morven ECR			Deployment Location	Environmental A frame	x	9.31	y	-14.81	z	5.97
Primary Positioning System	StarPack1			Actual Coordinates derived from	Beacon						
Geodetic Reference System	Datum	WGS 84 (18) to ED50	Ellipsoid	International 1924	Projection	UTM zone 30N			Vertical / Tidal Datum	LAT	

Date	Time (UTC/GMT)	Fix number	Stn No	Penetration	Sample Retention	Retention	Observed Seafloor Depth (m)	Actual coordinates		Target coordinates		Offset from target				Surveyor	Remarks
								Easting	Northing	Easting	Northing	dE	dN	Range	Bearing

APPENDIX A FIELD SAMPLING LOGS

Gardline — Seafloor Sampling Positioning Summary

Job No	54027			Vessel	*Ocean Geograph*						
Client	Morven Offshore Wind Limited			Vessel Reference Point (VRP)	COG						
Project Name	Morven ECR			Deployment Location	Environmental A frame	x	9.31	y	-14.81	z	5.97
Primary Positioning System	StarPack1			Actual Coordinates derived from	Beacon						
Geodetic Reference System	Datum	WGS 84 (18) to ED50	Ellipsoid	International 1924	Projection	UTM zone 30N			Vertical / Tidal Datum	LAT	

Date	Time (UTC/GMT)	Fix number	Stn No	Penetration	Sample Retention	Retention	Observed Seafloor Depth (m)	Actual coordinates		Target coordinates		Offset from target				Surveyor	Remarks
								Easting	Northing	Easting	Northing	dE	dN	Range	Bearing

APPENDIX A FIELD SAMPLING LOGS

Seafloor Sampling Positioning Summary

Job No	54027			Vessel	*Ocean Geograph*						
Client	Morven Offshore Wind Limited			Vessel Reference Point (VRP)	COG						
Project Name	Morven ECR			Deployment Location	Environmental A frame	x	9.31	y	-14.81	z	5.97
Primary Positioning System	StarPack1			Actual Coordinates derived from	Beacon						
Geodetic Reference System	Datum	WGS 84 (18) to ED50	Ellipsoid	International 1924	Projection	UTM zone 30N			Vertical / Tidal Datum	LAT

APPENDIX A FIELD SAMPLING LOGS

Gardline — Seafloor Sampling Positioning Summary

Job No	54027			Vessel	*Ocean Geograph*						
Client	Morven Offshore Wind Limited			Vessel Reference Point (VRP)	COG						
Project Name	Morven ECR			Deployment Location	Environmental A frame	x	9.31	y	-14.81	z	5.97
Primary Positioning System	StarPack1			Actual Coordinates derived from	Beacon						
Geodetic Reference System	Datum	WGS 84 (18) to ED50	Ellipsoid	International 1924	Projection	UTM zone 30N			Vertical / Tidal Datum	LAT	

Date	Time (UTC/GMT)	Fix number	Stn No	Penetration	Sample Retention	Retention	Observed Seafloor Depth (m)	Actual coordinates		Target coordinates		Offset from target				Surveyor	Remarks
								Easting	Northing	Easting	Northing	dE	dN	Range	Bearing

APPENDIX A FIELD SAMPLING LOGS

Gardline — Seafloor Sampling Positioning Summary

Job No	54027			Vessel	*Ocean Geograph*						
Client	Morven Offshore Wind Limited			Vessel Reference Point (VRP)	COG						
Project Name	Morven ECR			Deployment Location	Environmental A frame	x	9.31	y	-14.81	z	5.97
Primary Positioning System	StarPack1			Actual Coordinates derived from	Beacon						
Geodetic Reference System	Datum	WGS 84 (18) to ED50	Ellipsoid	International 1924	Projection	UTM zone 30N			Vertical / Tidal Datum	LAT	

Date	Time (UTC/GMT)	Fix number	Stn No	Penetration	Sample Retention	Retention	Observed Seafloor Depth (m)	Actual coordinates		Target coordinates		Offset from target				Surveyor	Remarks

APPENDIX A FIELD SAMPLING LOGS

Gardline — Seafloor Sampling Positioning Summary

Job No	54027			Vessel	*Ocean Geograph*						
Client	Morven Offshore Wind Limited			Vessel Reference Point (VRP)	COG						
Project Name	Morven ECR			Deployment Location	Environmental A frame	x	9.31	y	-14.81	z	5.97
Primary Positioning System	StarPack1			Actual Coordinates derived from	Beacon						
Geodetic Reference System	Datum	WGS 84 (18) to ED50	Ellipsoid	International 1924	Projection	UTM zone 30N			Vertical / Tidal Datum	LAT	

Date	Time (UTC/GMT)	Fix number	Stn No	Penetration	Sample Retention	Retention	Observed Seafloor Depth (m)	Actual coordinates		Target coordinates		Offset from target				Surveyor	Remarks
								Easting	Northing	Easting	Northing	dE	dN	Range	Bearing

APPENDIX A FIELD SAMPLING LOGS

Gardline — Seafloor Sampling Positioning Summary

Job No	54027			Vessel	*Ocean Geograph*						
Client	Morven Offshore Wind Limited			Vessel Reference Point (VRP)	COG						
Project Name	Morven ECR			Deployment Location	Environmental A frame	x	9.31	y	-14.81	z	5.97
Primary Positioning System	StarPack1			Actual Coordinates derived from	Beacon						
Geodetic Reference System	Datum	WGS 84 (18) to ED50	Ellipsoid	International 1924	Projection	UTM zone 30N			Vertical / Tidal Datum	LAT	

Date	Time (UTC/GMT)	Fix number	Stn No	Penetration	Sample Retention	Retention	Observed Seafloor Depth (m)	Actual coordinates		Target coordinates		Offset from target				Surveyor	Remarks
								Easting	Northing	Easting	Northing	dE	dN	Range	Bearing

APPENDIX A FIELD SAMPLING LOGS

Gardline — Seafloor Sampling Positioning Summary

Job No	54027			Vessel	*Ocean Geograph*						
Client	Morven Offshore Wind Limited			Vessel Reference Point (VRP)	COG						
Project Name	Morven ECR			Deployment Location	Environmental A frame	x	9.31	y	-14.81	z	5.97
Primary Positioning System	StarPack1			Actual Coordinates derived from	Beacon						
Geodetic Reference System	Datum	WGS 84 (18) to ED50	Ellipsoid	International 1924	Projection	UTM zone 30N			Vertical / Tidal Datum	LAT	

Date	Time (UTC/GMT)	Fix number	Stn No	Penetration	Sample Retention	Retention	Observed Seafloor Depth (m)	Actual coordinates		Target coordinates		Offset from target				Surveyor	Remarks
								Easting	Northing	Easting	Northing	dE	dN	Range	Bearing

APPENDIX A FIELD SAMPLING LOGS

Gardline — Seafloor Sampling Positioning Summary

Job No	54027			Vessel	*Ocean Geograph*						
Client	Morven Offshore Wind Limited			Vessel Reference Point (VRP)	COG						
Project Name	Morven ECR			Deployment Location	Environmental A frame	x	9.31	y	-14.81	z	5.97
Primary Positioning System	StarPack1			Actual Coordinates derived from	Beacon						
Geodetic Reference System	Datum	WGS 84 (18) to ED50	Ellipsoid	International 1924	Projection	UTM zone 30N		Vertical / Tidal Datum	LAT		

Date	Time (UTC/GMT)	Fix number	Stn No	Penetration	Sample Retention	Retention	Observed Seafloor Depth (m)	Actual coordinates		Target coordinates		Offset from target				Surveyor	Remarks
								Easting	Northing	Easting	Northing	dE	dN	Range	Bearing

APPENDIX A FIELD SAMPLING LOGS

Gardline — Seafloor Sampling Positioning Summary

Job No	54027			Vessel	*Ocean Geograph*						
Client	Morven Offshore Wind Limited			Vessel Reference Point (VRP)	COG						
Project Name	Morven ECR			Deployment Location	Environmental A frame	x	9.31	y	-14.81	z	5.97
Primary Positioning System	StarPack1			Actual Coordinates derived from	Beacon						
Geodetic Reference System	Datum	WGS 84 (18) to ED50	Ellipsoid	International 1924	Projection	UTM zone 30N			Vertical / Tidal Datum	LAT	

Date	Time (UTC/GMT)	Fix number	Stn No	Penetration	Sample Retention	Retention	Observed Seafloor Depth (m)	Actual coordinates		Target coordinates		Offset from target				Surveyor	Remarks
								Easting	Northing	Easting	Northing	dE	dN	Range	Bearing

APPENDIX A FIELD SAMPLING LOGS

Seafloor Sampling Positioning Summary

Job No	54027				Vessel	*Ocean Geograph*						
Client	Morven Offshore Wind Limited				Vessel Reference Point (VRP)	CoG						
Project Name	Morven ECR				Deployment Location	Camera Deployment Node	x	9.31	y	-14.81	z	5.97
Primary Positioning System	Starpack 1				Actual Coordinates derived from	Deployment Location						
Geodetic Reference System	Datum	ED50	Ellipsoid	International 1924		Projection	UTM Zone 30			Vertical / Tidal Datum	LAT	

Date	Time (UTC)	Fix number	Stn No	Penetration %	Sample Retention	Retention	Observed Seafloor Depth (m)	Actual coordinates		Target coordinates		Offset from target				Surveyor	Remarks
								Easting	Northing	Easting	Northing	dE	dN	Range	Bearing

APPENDIX A FIELD SAMPLING LOGS

Seafloor Sampling Positioning Summary

Job No	54027				Vessel	*Ocean Geograph*						
Client	Morven Offshore Wind Limited				Vessel Reference Point (VRP)	CoG						
Project Name	Morven ECR				Deployment Location	Camera Deployment Node	x	9.31	y	-14.81	z	5.97
Primary Positioning System	Starpack 1				Actual Coordinates derived from	Deployment Location						
Geodetic Reference System	Datum	ED50	Ellipsoid	International 1924		Projection	UTM Zone 30			Vertical / Tidal Datum	LAT	

Date	Time (UTC)	Fix number	Stn No	Penetration %	Sample Retention	Retention	Observed Seafloor Depth (m)	Actual coordinates		Target coordinates		Offset from target				Surveyor	Remarks
								Easting	Northing	Easting	Northing	dE	dN	Range	Bearing

APPENDIX A FIELD SAMPLING LOGS

Seafloor Sampling Positioning Summary

Job No	54027			Vessel	*Ocean Geograph*						
Client	Morven Offshore Wind Limited			Vessel Reference Point (VRP)	CoG						
Project Name	Morven ECR			Deployment Location	Camera Deployment Node	x	9.31	y	-14.81	z	5.97
Primary Positioning System	Starpack 1			Actual Coordinates derived from	Deployment Location						
Geodetic Reference System	Datum	ED50	Ellipsoid	International 1924	Projection	UTM Zone 30			Vertical / Tidal Datum	LAT	

Date	Time (UTC)	Fix number	Stn No	Penetration %	Sample Retention	Retention	Observed Seafloor Depth (m)	Actual coordinates		Target coordinates		Offset from target				Surveyor	Remarks
								Easting	Northing	Easting	Northing	dE	dN	Range	Bearing

APPENDIX A FIELD SAMPLING LOGS

Seafloor Sampling Positioning Summary

Job No	54027				Vessel	*Ocean Geograph*							
Client	Morven Offshore Wind Limited				Vessel Reference Point (VRP)	CoG							
Project Name	Morven ECR				Deployment Location	Camera Deployment Node	x	9.31	y	-14.81	z	5.97	
Primary Positioning System	Starpack 1				Actual Coordinates derived from	Deployment Location							
Geodetic Reference System	Datum	ED50	Ellipsoid	International 1924		Projection	UTM Zone 30			Vertical / Tidal Datum	LAT		

Date	Time (UTC)	Fix number	Stn No	Penetration %	Sample Retention	Retention	Observed Seafloor Depth (m)	Actual coordinates		Target coordinates		Offset from target				Surveyor	Remarks
								Easting	Northing	Easting	Northing	dE	dN	Range	Bearing

APPENDIX A FIELD SAMPLING LOGS

Water Sampling Positioning Summary

Job No	54027					Vessel	*Ocean Geograph*						
Client	Morven Offshore Wind Limited					Vessel Reference Point (VRP)	COG						
Project Name	Morven ECR					Deployment Location	Camera Deployment	x	9.31	y	-14.81	z	5.97
Primary Positioning System	StarPack1					Actual Coordinates derived from	Beacon						
Geodetic Reference System	Datum	ED50		Ellipsoid	International 1924		Projection	UTM Zone 30			Vertical / Tidal Datum	LAT	

Date	Time (UTC/GMT)	Fix number	Stn No	Penetration %	Sample Retention	Retention	Observed Seafloor Depth (m)	Actual coordinates		Target coordinates		Offset from target				Surveyor	Remarks
								Easting	Northing	Easting	Northing	dE	dN	Range	Bearing

APPENDIX B DATA ACQUISITION AND PROCESSING

B.1 Seabed Imagery Acquisition

Environmental seabed images were taken by means of a digital stills camera system with a dedicated strobe and video lamp(s), mounted within a stainless steel frame. Video footage was also acquired throughout the survey area using a HD video camera. A USBL positioning beacon was attached to the camera frame. Footage was viewed in real time via an umbilical, assisting in the control of the digital stills camera. This allowed for shot selection to capture sediment changes or features at the seafloor.

During acquisition, a minimum of 18 seabed photographs and 8 minutes of footage were collected at each station at appropriate intervals. This technique allowed the frame to move progressively along the seabed as the vessel traversed the work area on its thrusters or drifted. The images were captured remotely using the surface control unit and stored on the camera's internal memory card. Video footage was overlaid with time, position and depth, and recorded directly onto onboard server/PC hard drive. On completion, photographs were downloaded onto a PC via a USB download cable and copied onto a GSPEED. All GSPEEDs were labelled with the relevant job details, write-protected and stored.

During acquisition, a total of 6996 photos and 117 hours and 26 minutes of video footage were taken using the stills camera system across 133 stations. An additional 4566 video frames were captured from the video footage and reviewed onshore. A selection of seabed photographs is presented in Appendix C, whilst environmental deck and positioning logs are contained in Appendix A.

Table B.1 Camera Equipment Specifications

Equipment	HD Camera System	Stills Camera System
Manufacturer	SubC Control Ltd.	Kongsberg/Simrad.
Model	1Cam Alpha Mk5/6	OE14-208
Lens	Wide angle (26.3mm), f 3.8 ~ 38.0 mm (5/32 ~ 1 1/2 in.), 10x optical zoom and automatic or manual focus control	f 7.2 – 28.8 (35mm format equivalent to 38 – 140mm) 4x optical zoom and automatic or manual focus control
Pixels	12.0 M (Picture mode) OR 8.3 M (Video mode)	5.0 M
Video Resolution	1920 x 1080p	PAL 625 Line/50 Hz PAL
Image Resolution (pixels)	No stills in HD video mode	2592 x 1944
Field of View	47.8° horizontal (β) by 36.2° vertical (α)	48.4° horizontal (β) by 29.9° vertical (α)
Video Overlay	EdgeDVR Inspection System (Digital Edge Subsea (Ltd)	
Trigger	Remote from deck	
Height Control	USBL Beacon and/or Video footage	
Lighting	1 fixed forward facing strobe, 2 fixed LED lamps	
Scale bar	Green line lasers with 105mm separation between lines.	
Housing	Standard Frame	

Table unit definitions: M = megapixels, p = progressive scan, PAL = phase alternating line, Hz = Hertz

B.2 Benthic Sampling

Benthic samples were recovered using an in-house constructed, modified, stainless-steel 0.1m^2 Day grab. The Day grab carried extra weights where appropriate to induce better penetration on impact and an extended bucket lip to reduce sediment washout. Storm feet and elastic straps were used to reduce the likelihood of the instrument pre-triggering in the water column during deployment. A USBL positioning beacon was attached to the deployment cable immediately above the grab.

Grab sampling operational procedures were as follows:

The vessel's sampling area was pre-cleaned using a powerful deck fire-hose and seawater. The Day grab was thoroughly washed down using pentane prior to deployment at every station to prevent hydrocarbon cross contamination. A 13mm, dry-core, galvanised-steel cable was used to lower the Day grab to the seabed.

All containers were thoroughly washed with appropriate solvents and labelled externally prior to use. Biology samples were placed in 1-litre polypropylene, screw-top, squat jars and 5 litre buckets and provided with an additional internal waterproof label. Hydrocarbon samples were placed in 120ml glass jars, whilst the remaining samples (metals and particle size) were placed in double-lined zip-lock bags.

For accuracy of grab sampling in deeper waters, the Day grab was winched down so that it was approximately 10-15m from the seabed prior to release to sea floor. Communication between the deck, bridge crew and the surveyors was conducted by means of VHF radio. When directly over the sampling station the grab was winched to the seabed and recovered so that the sample could be obtained and the apparatus prepared for the next deployment.

Positional fixes were taken for each grab sample immediately following the grab reaching the sea floor. The precise time that the grab reached the seabed was determined by observations of the tension on the winch cable.

On recovery of a sample, the grab would first be examined for acceptability following strict quality assurance criteria. In the following cases, a sample would be rejected and the instrument prepared for the next deployment:

1. Jammed sample closure due to entrapment of a large stone, shell or other objects allowing surface sediment washout.
2. Accidental premature opening of sampler on recovery, causing possible surface washout.
3. Half sample obtained where the grab has not struck a flat area of bottom, or not hit true, causing a side or half bite of sediment.
4. Disruption of the sample by obvious shaking or contamination (these can occur when a sample is badly handled or if the grab strikes the side of the vessel during operations).
5. The sample represents less than 40% of the grab's total capacity (*i.e.* less than 6 litres) or totally fills the grab.
6. Sample was acquired more than 10m from the target (as determined by the onboard surveyors, environmentalist and client representative, with consideration of the survey objectives);
7. The presence of exopolymeric substances, mucus coagulants and/or fauna that generate them *i.e.* Myxinidae.

Brief descriptions of the collected sediments were made at the time of sampling. These were recorded in the environmentalist's log sheets and are presented in Appendix A. A selection of photographs, taken of the sediment samples whilst in the Day grab, is presented in Appendix C.

Sediment samples collected for physio-chemical analysis (CHEM) were sub-sampled into the relevant containers. All containers were thoroughly washed with the appropriate solvents and labelled externally prior to use. Where sediment samples were collected to be processed using MMO (2023) methodology chemical analysis was sub-sampled into a 1 litre glass jar along with the spare. Particle size analysis (PSA), and a spare sample were collected at all stations using a plastic scoop and stored in double-lined zip-lock bags. Where additional analysis was required (Scottish waters) two surficial (<2cm depth) sediments were scooped using a stainless-steel spoon into 120ml amber glass jars that had been previously washed with pentane to remove any organic contaminants; one of these was intended for hydrocarbon determinations, the other was retained as a spare. A plastic scoop was the used to obtain two further sub-samples; one for analysis of metals, and a spare sample. These were placed in double zip-locked bags. All the physico-chemical samples were transferred to an onboard freezer for storage at less than -18°C.

Sediment eDNA was collected from each faunal sample analyses and stored in a double lined zip-lock bag and transferred to an onboard freezer for storage. Following this, samples were thoroughly washed from the grab into a plastic tray. Once all equipment was washed free of sediment, the sediment sample was transferred to a sieving machine where it was broken down using a low powered seawater spray. All materials retained by the 500µm mesh sieve were transferred to a squat jar or bucket by means of scoop and funnel, making sure that none of the sample was lost or trapped in the mesh. The samples were fixed with a pre-buffered <10% formalin solution of known concentration, then subsequently diluted to a final concentration of approximately 4% formalin. Biological samples were placed in 1 litre polypropylene screw-top squat jars or 5 litre buckets, depending on sample size, and provided with an additional internal waterproof label.

B.3 Water sampling

Niskin bottles were mounted directly to a 10mm dry-core galvanised-steel deployment cable along with a 25kg purse weight to maintain vertical transit. Messenger weights were affixed to allow acquisition of the samples. A depth enabled USBL beacon was attached below the deepest Niskin bottles prior to the release of the top messenger and used to determine depth and location prior to release of the messenger, positional fixes were taken immediately after release of the messenger and prior to recovery.

On recovery of the water sample the Niskin bottle was examined for acceptability following strict quality assurance criteria. In the following cases, a Niskin bottle sample would be rejected and the instrument returned to the pre-deployment position:

1. One or both ends had not release and the sampler had failed to trigger.
2. One or both ends failed to seal the sampler and water had leaked out.
3. Disruption of the sample by obvious shaking or contamination.
4. Sample was taken from and unacceptable depth or more than 10m form the target.

Water samples were taken at two depths per station: five metres below the water and five metres above the seabed. Two litres of water were filtered through a 0.8µm pore size CN filter and transferred to an onboard freezer for storage at less than -18°C.

B.4 Imagery Processing

Seabed photos were assessed using the Gardline developed imagery analysis program (CountEM). The program allows for individual fauna to be tagged and a sediment description to be assigned to each image. The software allows features to be selected within an image to provide an accurate figure of percentage coverage of each individual element (*e.g.* cobbles and boulders, sponge) based upon the proportion of pixels. CountEM can also measure the area of seabed and observed features primarily in pixels, though this can be converted to

millimetres (mm) given a reference scale within the image, such as using two laser lines with a known separation. Further, laser scale lines were used to calculate an approximate area for each photo using methodologies developed from Wakefield and Genin (1987).

Gardline has developed an institution-level reference image catalogue of operational taxonomic units (OTUs) or morphospecies based on Howell *et al.* (2019). Where examples within the images were matched with a morphotype already included within the OTU database these have been given the suffix GLXXXX. To standardise image-based identification, nomenclature based on Horton *et al.* (2021) has been used within the project. *Incerta* (*inc*.) was used to denote where a taxon is identifiable to a certain taxonomic level but the identification is not certain, *indeterminabilis* (*indet*.) was used for a taxon that is unidentifiable below a certain taxonomic level due to image quality or lack of clarity in a image while *stetit* (*stet*.) was used for taxon that are identifiable to a certain taxonomic level with certainty but a decision has been made to not identify further or a lack of resources has led to no further identification.

Each visible morphotype was tagged once in each photograph to record its presence. The exceptions were specific features or taxa of potential interest as described in Section 1.1, such as *P. phosphorea* and burrows, which were enumerated from all photographs to allow assessment for the presence of protected habitats.

In addition to the photographs taken across the targets, video footage was reviewed and video frames were captured whenever any further observations of specific features or taxa of potential interest occurred. This resulted in an additional 4566 video frames, which were analysed in CountEM. Other than enumerating any specific features or taxa of potential interest in these video frames images and tagging as present any previously unobserved morphotypes, no further tagging or video frames were conducted.

Following quality control, data were exported into an excel file used to summarise seabed imagery observations and allow for further analysis as applicable. A reference collection of taxa ID is presented in Appendix E.

B.5 Habitat Analysis

B.5.1 Sea Pen and Burrowing Megafauna Communities

Clarifications on the identification of OSPAR description of the habitat were summarised in a report by the JNCC (2014b) to improve the definition and correct identification of this habitat. These clarifications suggest that burrowed areas of mud should be deemed to be a ‘sea pen and burrowing megafauna communities’ habitat regardless of the presence of sea pens, if multiple sightings of burrows and/or mounds attributable to the relevant species are observed. Furthermore, although the habitat occurs predominantly in fine mud sediments, examples of the habitat have been identified in areas of sandy muds where there is clear evidence of the relevant biological assemblages (burrowing megafauna and in some examples, sea pens). Consequently, habitats can be classed as ‘sea pen and burrowing megafauna communities’ regardless of the grain size composition of the sediment (JNCC, 2014b). The report (JNCC, 2014b) also recommends that the definition should extend further than the habitat classification biotope ‘sea-pens and burrowing megafauna in circalittoral fine mud’ (Connor *et al.*, 2004) since additional biotopes are also considered to be associated with the habitat.

The clarifications (JNCC, 2014b) advocate utilising seabed video imagery and/or photographs to confirm the presence of burrows and/or mounds and sea pens, where present. Whilst from seabed grab samples, identification would confirm associated fauna and particle size analysis (PSA) data a fine mud/sandy mud habitat. The density classifications as laid out by the Marine Nature Conservation Review (MNCR) SACFOR scale (JNCC, 2013) were used to quantify these defining features (see Table B. 2). The JNCC (2014b) clarification report specifies that multiple sightings of burrows and/or mounds attributable to relevant species together with sea pens, if present, should be classified as at least ‘frequent’ for their size on the SACFOR scale

in order to be considered a 'sea pen and burrowing megafauna communities' habitat. However, it acknowledges the inherent difficulties of identifying species from burrow type alone using ever evolving guides, such as those cited by the ICES (2011) guide. Subsequently, the overall density of burrows themselves were assessed instead, in order to consider whether their density was a 'prominent' feature of the sediment surface and potentially indicative of a sub-surface complex gallery burrow system.

Table B. 2 SACFOR Abundance Scale

Density	Size of Individuals			
	<1cm	1-3cm	3-15cm	>15cm
≥10000 m^{-2}	S	S	S	S
≥1000 m^{-2} to <10000 m^{-2}	A	S	S	S
≥100 m^{-2} to <1000 m^{-2}	C	A	S	S
≥10 m^{-2} to <100 m^{-2}	F	C	A	S
≥1 m^{-2} to <10 m^{-2}	O	F	C	A
≥0.1 m^{-2} to <1 m^{-2}	R	O	F	C
≥0.01 m^{-2} to <0.1 m^{-2}	R	R	O	F
≥0.001 m^{-2} to <0.01 m^{-2}	R	R	R	O
<0.001 m^{-2}	R	R	R	R

S= Superabundant, A = Abundant, C = Common, F = Frequent, O = Occasional and R = Rare. Table amended from: JNCC (2013).
For sedentary species attached to the substratum, percentage cover should be used in preference to the density scale whenever possible.

B.5.2 Rocky Reefs

A multi-criteria scoring system; see Table B.3, was used to assess the characteristics of the potential stony reef. Each characteristic was scored as low, medium or high; with spatial extent (m^2), substratum composition (% cover) and elevation (m) as the primary characteristics, as defined by Irving (2009).

Table B.3 Stony Reef Criteria

Characteristic	Resemblance to 'Stony Reef'			
	Not a 'Stony Reef'	Low	Medium	High
Composition	<10% cobbles/boulders	10 - <40% cobbles/boulders	40 - <95% cobbles/boulders	≥95% cobbles/boulders
		Matrix supported: dominated by sediment	Clast supported: dominated by cobbles/boulders	Clast supported: dominated by cobbles/boulders
Elevation	Flat seabed	<0.064m	0.064 - <5m	≥5m
Extent	≤25m^2	>25m^2	>25m^2	>25m^2
Biota	Dominated by infaunal species			>80% of species present composed of epifaunal species

Stony reef assessment criteria adapted from Irving (2009)

B.5.3 Herring Spawning

Determination of spawning potential for a specific area of seabed is been based on guidelines provided by Cefas (2001) and Reach *et al.* (Reach *et al.*, 2013 in; MarineSpace Ltd *et al.*, 2013), summarised in Table B.4 and a variety of measured and inferred sedimentological and hydrodynamic characteristics.

In order to be classified as 'Prime' or 'Sub-Prime' under the habitat sediment preference criteria for herring spawning (Reach *et al.*, 2013 in; MarineSpace Ltd *et al.*, 2013), the sediment must be composed of >50% or >25% gravel (>2mm), respectively, with little (<5%) mud (<63µm, silt and clay). In general terms, the area must fall into one of three sediment types based on the modified Folk (1954) classification: gravel, sandy gravel or gravelly sand. As acknowledged by Reach *et al.* (2013 in; MarineSpace Ltd *et al.*, 2013) and as previously defined by Cefas (2001), use of the modified Folk classification alone may over-estimate the suitability of an

area in terms of its herring spawning potential as further consideration should be given to other environmental (physical, chemical and abiotic) parameters such as oxygenation, siltation, micro-scale morphological features (*e.g.* ripples and ridges). Furthermore, the area must be exposed to the main flow of water and the sediments wells sorted in order to ensure maximum oxygenation of the sediment and hence the lower layers of herring eggs; the area should be elevated with respect to the surrounding seabed.

Based on these criteria, the herring spawning potential of each station/transect was graded from 'Unsuitable' to 'Prime' based on habitat sediment preference and 'Unsuitable' to 'Preferred' based on habitat sediment class, as presented in Table B.4.

Table B.4 Herring Spawning Ground Potential Criteria

Criteria From	Habitat Sediment Preference[1]	Unsuitable	Suitable	Sub-Prime	Prime
Sediment Classes (Reach *et al.*, 2013 in; MarineSpace Ltd *et al.*, 2013)	% Particle Contribution Preference	>5% muds, <10% gravel	<5% muds, >10% gravel	<5% muds, >25% gravel	<5% muds, >50% gravel
	Modified Folk classification (based on sand, mud, gravel fractions above)	Everything excluding gravel, sandy gravel and part gravelly sand	Part gravelly sand	Part sandy gravel and part gravelly sand	Gravel and part sand gravel
Further sediment Description Parameters (including those from Cefas (2001))	% coarse sand to gravel	≤20%	20% to <40%	40% to <60%	≥60%
	Sorting coefficient and description (Folk & Ward, 1957)	≥1.00, poor to extremely poor	0.71 to <1.00, Moderate	0.5 to <0.71, Moderately well	≤0.5, Well
	Wentworth (1922) Classification of mode grain size	Silts and clays	Very fine to medium sand	Coarse to very coarse sand	Granule to pebble
	Exposure	Flat seabed			Elevated (such as raised gravel banks) relative to surrounding seabed
Criteria From	**Habitat Sediment Class[2]**	**Unsuitable**	**Marginal**	**Preferred**	
Sediment Classes (Reach *et al.*, 2013 in; MarineSpace Ltd *et al.*, 2013)	Generalised Folk Classification Preference	All others	Gravelly sand	Gravel and sandy gravel	

1 Colours indicate where Prime, Sub-Prime, Suitable or Unsuitable spawning potential criteria are met
2 Colours indicate where Preferred, Marginal or Unsuitable spawning potential criteria are met

B.5.4 Sand Eel Spawning

Determination of spawning potential for a specific area of seabed has been based on guidelines laid out in Latto *et al.* (2013), as summarised in Table B. 5. In order to be classified as 'Prime' or 'Sub-Prime' for sand eel spawning, the sediment must be composed of >85% or >70% sand (≥63µm, <2mm), respectively, with little mud (<1% or 4%; <63µm) and gravel (<15% or <25%; >2mm). Although these criteria do not easily blend with the modified Folk (1954) classification; in general terms the area must fall into one of three sediment types: sand, slightly gravelly sand or gravelly sand. Beyond this, 'Suitable' conditions are those where the sediment is

composed of >50% sand, <10% mud and <35% gravel and while this covers parts of several modified Folk (1954) classifications, sandy gravel is generally considered the marginal seabed type.

Sand eels were found by Holland *et al.* (2005) to have a preference against sediments finer than 0.25mm, which cover muds and a portion of the sand Folk category (63µm to 2mm) and therefore includes a portion of less suitable sediment. As mentioned above Latto *et al.* (2013) bases its categorisation of the sediment on the modified Folk (1954) classification for comparison to the pre-existing BGS charts to allow a broadscale assessment of potential sand eel spawning suitability and this method is likely to overstate the suitability of sediment to support populations of sand eels.

Based on these criteria, the sand eel spawning potential of each station was graded from 'Unsuitable' to 'Prime' based on habitat sediment preference, as presented in Table B. 5.

Table B. 5 Sand Eel Spawning Potential

Criteria From	Habitat Sediment Preference[1]	Unsuitable	Suitable	Sub-prime	Prime
Sediment Classes	% Particle contribution preference	>10% muds, <50% sand, >35gravel	<10% muds, >50% sand, <35% gravel	<4% muds, >70% sand, <35% gravel	<1% muds, >85% sand, <15% gravel (inferred)
	Folk classification based on % particle contribution preferences above	All others (including mS, (g)mS, part gmS, part msG and part sG)	Part S, part (g)S, part gS, part sG, part mS, part (g)mS, part gmS and part msG.	Part S, part (g)S, and part gS	Part S, part (g)S, and part gS
Criteria From	Habitat Sediment Class[2]	Unsuitable	Marginal	Preferred	
Sediment Classes	Folk classification generalised	All others	Sandy gravel	Sand, slightly gravelly sand and gravelly sand	

Adapted from Latto *et al.* (2013)

1 Colours indicate where Prime, Sub-Prime, Suitable or Unsuitable spawning potential criteria are met.

2 Colours indicate where Preferred, Marginal or Unsuitable spawning potential criteria are met.

B.6 Particle Size Analysis

Particle size analysis was carried out by Thomson Environmental Consultants Limited in accordance with NMBAQC methods for diamictons (Mason, 2022).

No dispersants were used and the sediment was not treated to remove carbonates. The range of sieve sizes, together with their Wentworth classifications (Wentworth, 1922), is given in Table B.6.

The results, given in Appendix E, present particle size distributions in terms of mean phi, fraction percentages (*i.e.* gravel, sand and fines), sorting (mixture of sediment sizes) and skewness (weighting of sediment fractions above and below the mean sediment size) (Folk & Ward, 1957). These indices are described below:

1. Graphic Mean - a measure of average particle size in phi units (-log2(diamm), Folk & Ward, 1957).

$$M_z = \frac{\emptyset 16 + \emptyset 84 + \emptyset 50}{3}$$

where M_z= The graphic mean particle size in phi
ø = the phi size of the nth percentile of the sample

2. Sorting – the inclusive graphic standard deviation of the sample is a measure of the degree of sorting. Sorting classifications are presented in Table B.7.

$$\sigma_1 = \frac{\emptyset 84 - \emptyset 16}{4} + \frac{\emptyset 95 - \emptyset 5}{6.6}$$

where σ_1 = the inclusive graphic standard deviation

3. Inclusive Graphic Skewness – the degree of asymmetry of a frequency or cumulative curve, Skewness classification are presented in Table B.8.

$$S = \frac{\emptyset 16 + \emptyset 84 - 2(\emptyset 50)}{2(\emptyset 84 - \emptyset 16)} + \frac{\emptyset 5 + \emptyset 95 - 2(\emptyset 50)}{2(\emptyset 95 - \emptyset 5)}$$

where S = the skewness of the sample

4. Graphic Kurtosis – The degree of peakedness or departure from a ‘normal’ frequency or cumulative curve. Kurtosis classifications are presented in Table B.9.

$$K = \frac{\emptyset 95 - \emptyset 5}{2.44(\emptyset 75 - \emptyset 25)}$$

where K= Kurtosis

The sediment samples were additionally classified using the modified Folk triangle classification and the EUNIS classification (Figure B. 1) with results presented in Appendix E. These classifications use the sand:mud ratio and the percentage of gravel (Folk, 1954; Parry, 2019).

Table B.6 Phi and Sieve Aperture with Wentworth Classifications

Aperture in microns	Aperture in Phi Unit	Sediment Description	
≥16000	≤-4	Pebble	GRAVEL
<16000 to 11200	>-4 to -3.5		
<11200 to 8000	>-3.5 to -3		
<8000 to 5600	>-3 to -2.5		
<5600 to 4000	>-2.5 to -2		
<4000 to 2800	>-2 to -1.5	Granule	
<2800 to 2000	>-1.5 to -1		
<2000 to 1400	>-1 to -0.5	Very Coarse Sand	SAND
<1400 to 1000	>-0.5 to 0		
<1000 to 710	>0 to 0.5	Coarse Sand	
<710 to 500	>0.5 to 1		
<500 to 355	>1 to 1.5	Medium Sand	
<355 to 250	>1.5 to 2		
<250 to 180	>2 to 2.5	Fine Sand	
<180 to 125	>2.5 to 3		
<125 to 90	>3 to 3.5	Very Fine Sand	
<90 to 63	>3.5 to 4		
<63 to 44	>4 to 4.5	Coarse Silt	FINES
<44 to 31.5	>4.5 to 5		
<31.5 to 22	>5 to 5.5	Medium Silt	
<22 to 15.6	>5.5 to 6		
<15.6 to 11	>6 to 6.5	Fine Silt	
<11 to 7.8	>6.5 to 7		
<7.8 to 5.5	>7 to 7.5	Very Fine Silt	
<5.5 to 3.9	>7.5 to 8		
<3.9 to 2.8	>8 to 8.5	Clay	
<2.8 to 2	>8.5 to 9		
<2 to 1.4	>9 to 9.5		
<1.4 to 1	>9.5 to 10		
<1	>10		

Table B.7 Sorting Classifications

Sorting Coefficient (Graphical Standard Deviation)	Sorting Classifications
0 < 0.35	Very well sorted
0.35 < 0.50	Well sorted
0.50 < 0.71	Moderately well sorted
0.71 < 1.00	Moderately sorted
1.00 < 2.00	Poorly sorted
2.00 < 4.00	Very poorly sorted
4.00	Extremely poorly sorted

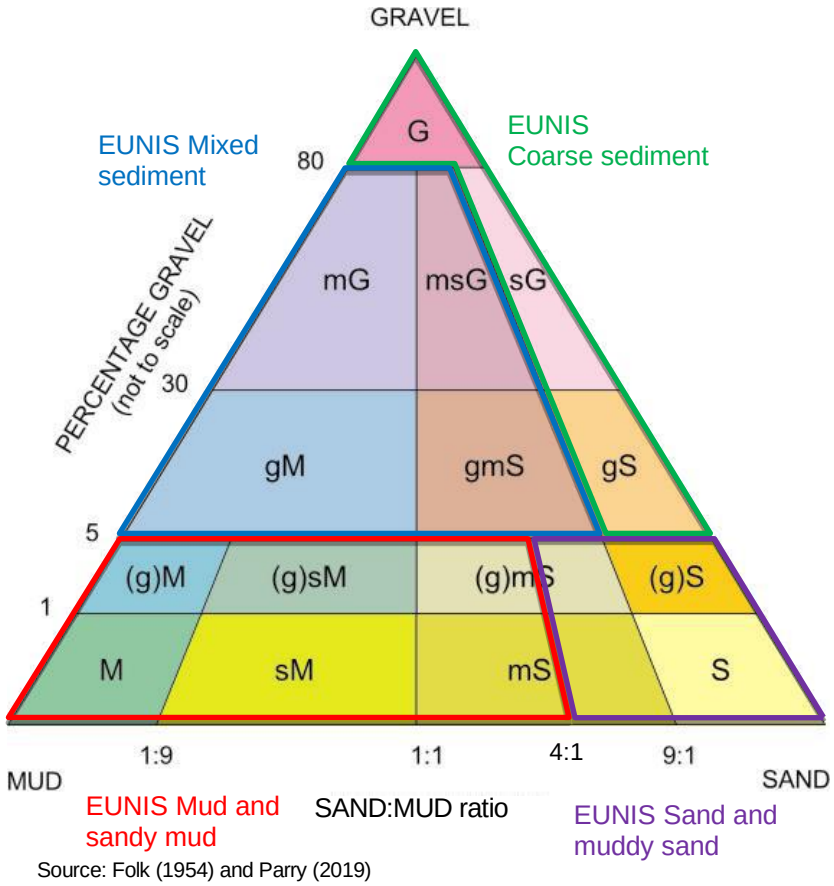

Table B.8 Skewness Classification

Skewness Coefficient	Mathematical Skewness	Graphical Skewness
1.00 > 0.30	Strongly Positive	Strongly fine skewed
0.30 > 0.10	Positive	Fine skewed
0.10 > -0.10	Near Symmetrical	Symmetrical
-0.10 > -0.30	Negative	Coarse skewed
-0.30 > -1.00	Strongly Negative	Strongly coarse skewed

Table B.9 Kurtosis Classification

Kurtosis Coefficient	Kurtosis Classification	Graphical meaning
≤ 0.67	Very Platykurtic	Flat-peaked; the ends are better sorted than the centre
0.67 < 0.90	Platykurtic	
0.90 < 1.11	Mesokurtic	Normal; bell shaped curve
1.11 < 1.50	Leptokurtic	Curves are excessively peaked; the centre is better sorted than the ends
1.50 < 3.00	Very Leptokurtic	
≥ 3.00	Extremely Leptokurtic	

Figure B. 1 Modified Folk Classification and EUNIS Sediment Classes

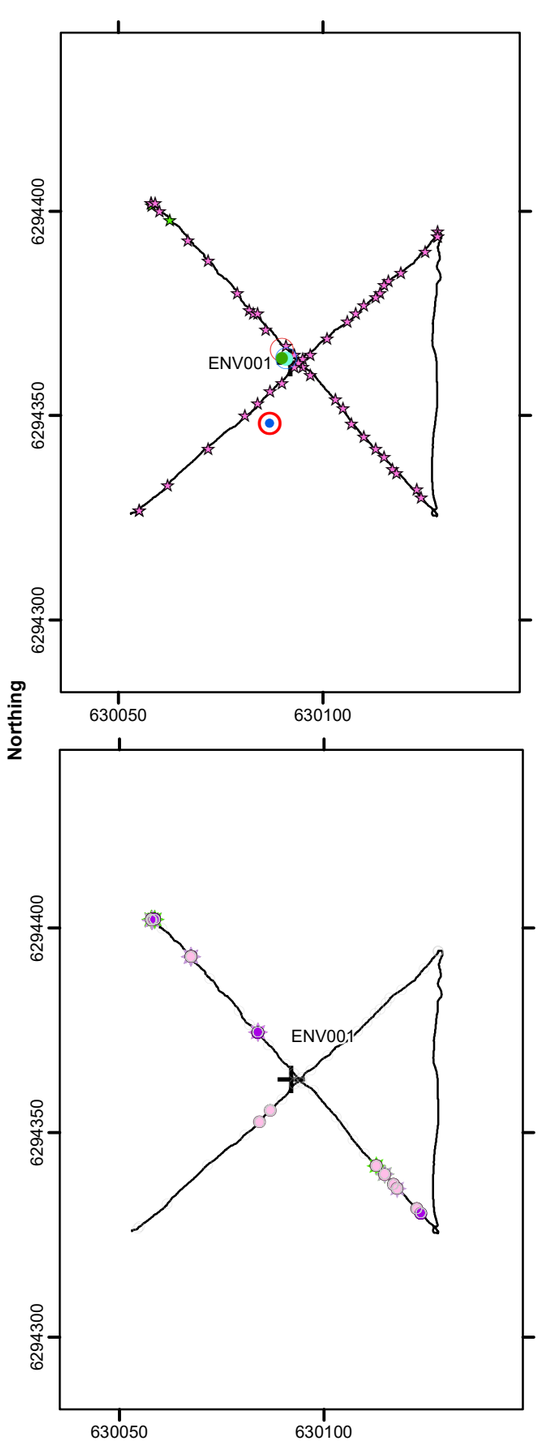
Source: Folk (1954) and Parry (2019)

Code	Modified Folk Classification
G	Gravel
mG	Muddy gravel
msG	Muddy sandy gravel
sG	Sandy gravel
gM	Gravelly mud
gmS	Gravelly muddy sand
gS	Gravelly sand
(g)M	Slightly gravelly mud
(g)sM	Slightly gravelly sandy mud
(g)mS	Slightly gravelly muddy sand
(g)S	Slightly gravelly sand
M	Mud
sM	Sandy mud
mS	Muddy sand
S	Sand

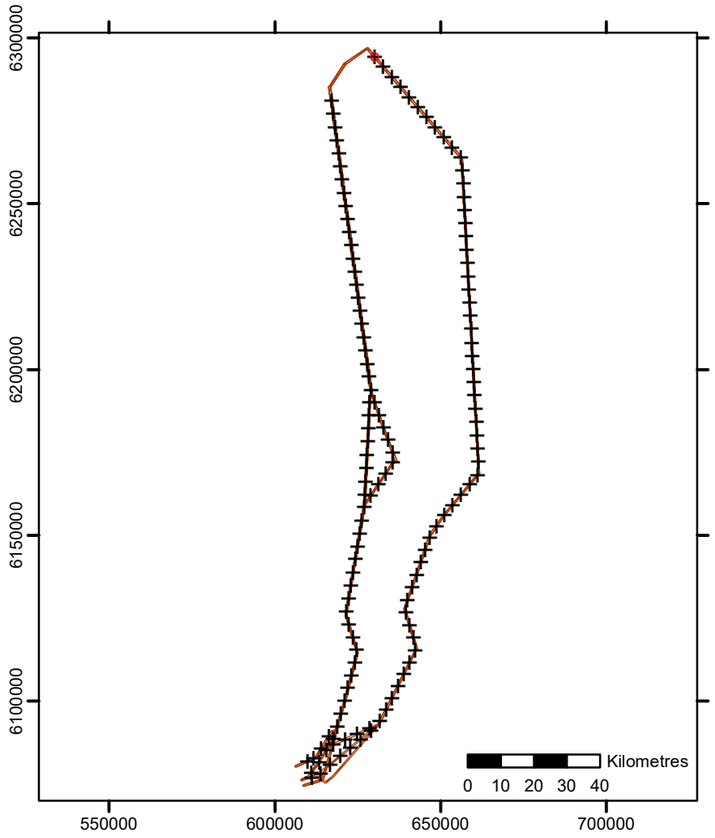
B.7 EUNIS Habitat Classification

Habitat classification is used to identify different habitats and biotopes based on the biotic and abiotic features of the seabed. Habitat and biotope classifications were conducted on the available survey data, adhering to protocols within EUNIS. The system was developed between 1996 and 2001 by the EEA in collaboration with European experts. Table B.10 gives examples of the five EUNIS levels used to describe the marine environments.

Table B.10 Example EUNIS Habitat Classification Levels



Level	Detail Covered (EUNIS code)
1. Environment	Marine benthic habitats (M)
2. Broad habitats	Circalittoral biogenic habitat (MC2)
3. Main habitats	Atlantic circalittoral biogenic habitat (MC 22)
4. Biotope complexes	Worm reefs in the Atlantic circalittoral zone (MC221)
5. Biotopes	*Sabellaria spinulosa* on stable Atlantic circalittoral mixed sediment (MC2211)



Development of the EUNIS classification comes from both a top-down and a bottom-up approach. The first division is based on differentiating between major biological zones related to depth (littoral down to abyssal) and differentiation of substrate type *(e.g.* rock, sand, gravel). These high-level divisions can be further subdivided based on the main biogeographical regions of Europe's seas (*e.g.* Arctic, Baltic, Atlantic) with these regional splits being based on a combination of salinity and temperature. Such broad-scale differences in habitat character are readily understood by non-specialists and provide classification types that are easily mapped. However, they also have ecological relevance as they reflect major changes in habitat character upon which species distribution depends (Connor *et al.*, 2004).

Bottom-up classification differentiates between places with different species communities. Relative species composition, diversity and abundance vary from place to place and are dependent both on environmental characteristics and upon interactions between species. Surveyed sites with similar environmental characteristics, such as sediment type and depth, show certain levels of similarity in their species communities.

Sand with shell fragments

Faunal Description:
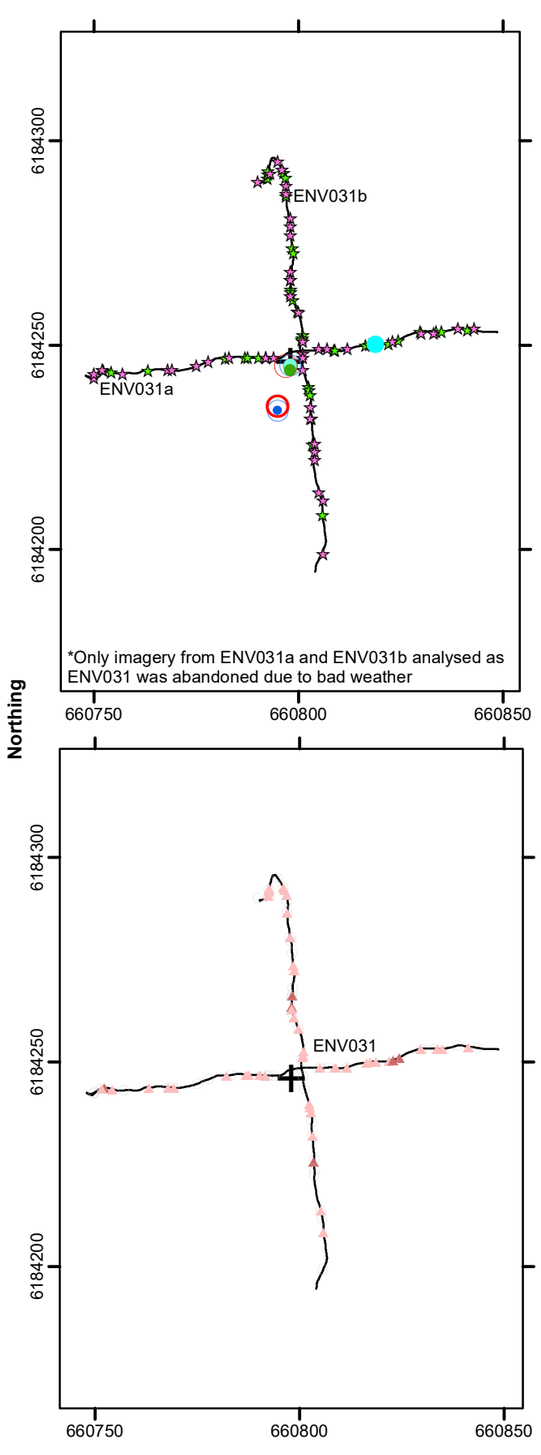
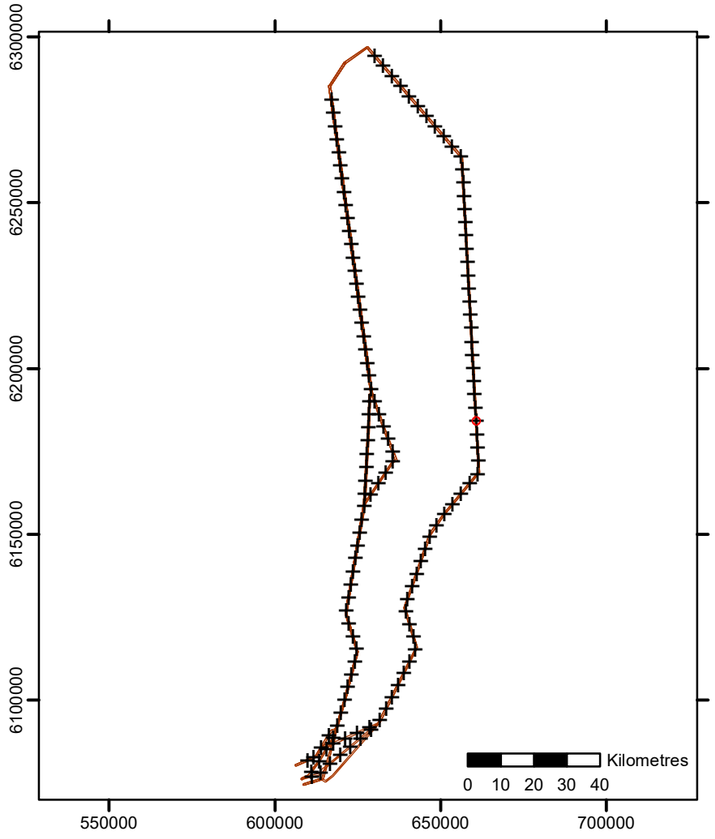
Annelida (Polychaeta), Echinodermata (Echinoidea), Mollusca (Bivalvia, Scaphopoda)





Station: ENV030
Fix: 244 **E:** 660579 **N:** 6188237 **Depth (m):** 76
Retention: MFA

Sediment Description:
Sand with shell fragments

Faunal Description:
Annelida (Polychaeta), Echinodermata (Echinoidea), Mollusca (Bivalvia, Scaphopoda)

APPENDIX C SAMPLING AND SEABED PHOTOGRAPHS AND LOCATIONS

Overview of Station: ENV031

Key

- Station Targets
- Morven ECR
- Environmental Camera Transect
- Camera Fix
- Videoframe

Environmental Samples acquired

- Macrofaunal Sample A
- Macrofaunal Sample B
- CHEM Sample 1
- CHEM Sample 2
- PSA
- No Sample

Water Sample Retention

- Fish eDNA - Surface
- Fish eDNA - Seabed
- No Sample

Rocky Reef Resemblance

- Low
- Medium
- No Resemblance

Burrows

- 1-2
- 2-4
- 4-6
- 6-8
- 8-11

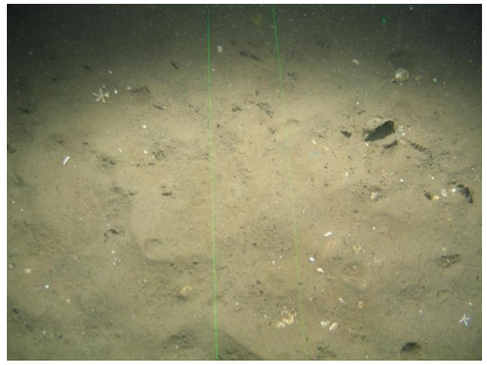
Virgularia stet.

- 1
- 2
- 3
- 4

Pennatula phosphorea

- 1
- 2
- 3
- 4
- 5

Protected Taxa

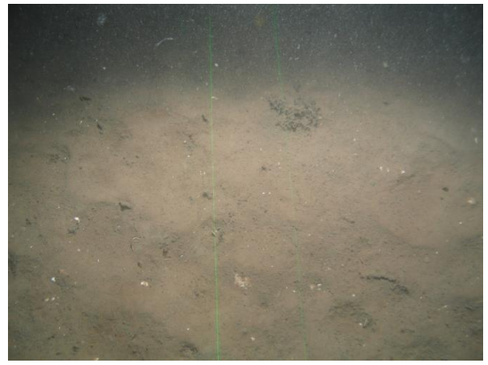


- *Ammodytidae stet.*
- *Glyptocephalus cynoglossus*
- *Lophius piscatorius*
- *Melanogrammus aeglefinus*
- *Merlangius merlangus*
- *Pleuronectes platessa*
- *Arctica islandica* siphon
- *Modiolus modiolus*

Scale (Unless otherwise stated): Metres
0 15 30 45 60

N

Coordinate System: ED195 UTM Zone 30N
Projection: Transverse
Mercator Datum: European 1950
Central Meridian: 3.0°W



Easting

Station: ENV031
Fix: 1506 **E:** 660794 **N:** 6184247 **Depth (m):** 73

Sediment Description:
Soft sediment with shell fragments

Faunal Description:
Echinodermata (*Asterias rubens*, *Astropecten irregularis*)

Station: ENV031
Fix: 1503 **E:** 660783 **N:** 6184247 **Depth (m):** 73

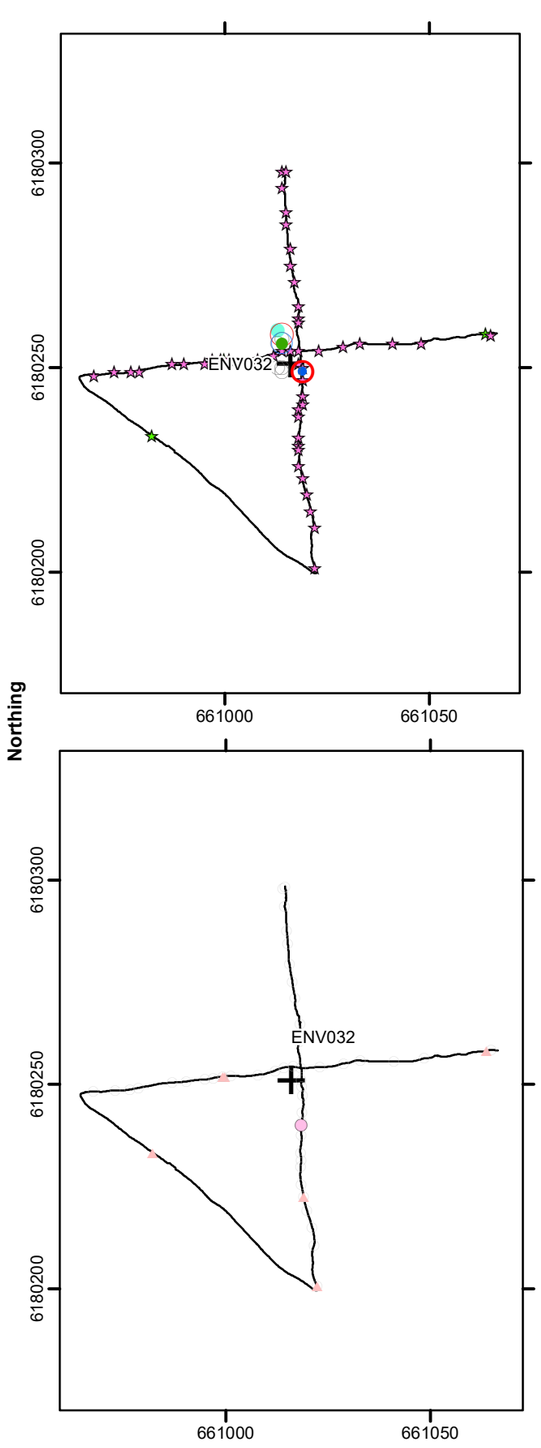
Sediment Description:
Soft sediment

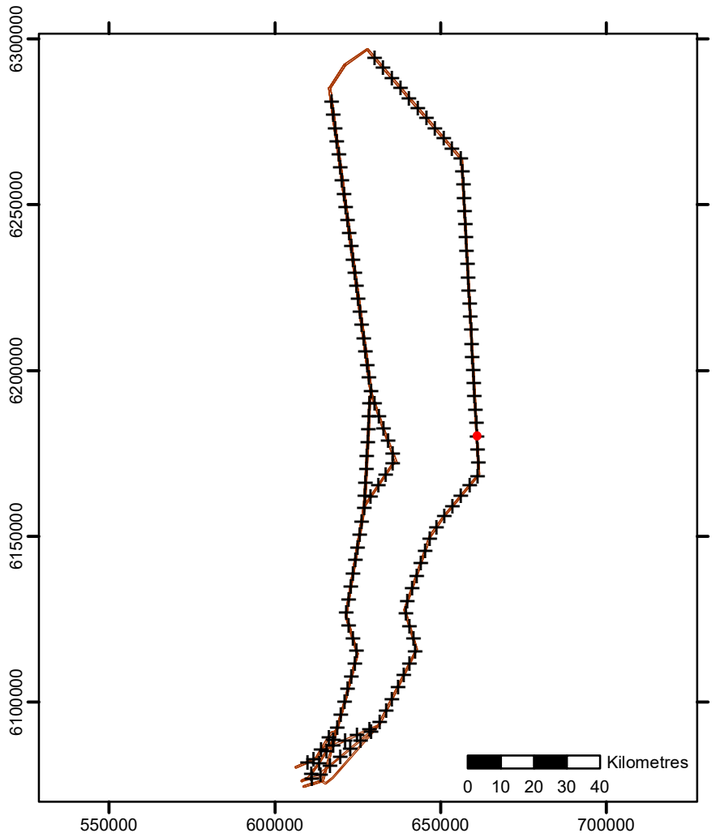
Faunal Description:
Faunal turf

Station: ENV031
Fix: 251 **E:** 660798 **N:** 6184245 **Depth (m):** 75
Retention: MFB

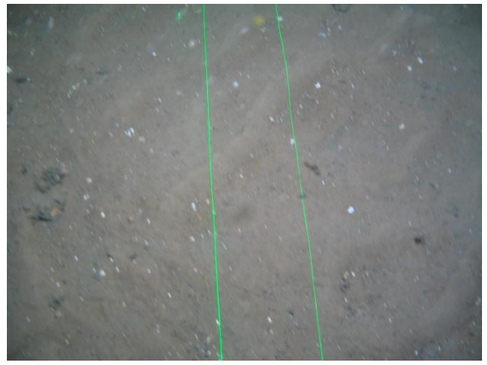
Sediment Description:
Fine sand with shell fragments

Faunal Description:
Annelida (Polychaeta), Echinodermata (Echinoidea), Mollusca (Scaphopoda)





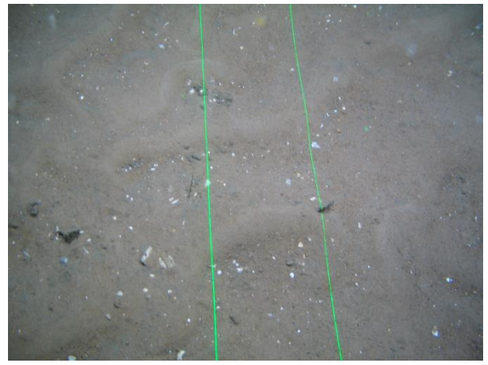
Station: ENV031
Fix: 251 **E:** 660798 **N:** 6184245 **Depth (m):** 75
Retention: MFB



Sediment Description:
Fine sand with shell fragments

Faunal Description:
Annelida (Polychaeta), Echinodermata (Echinoidea), Mollusca (Scaphopoda)

APPENDIX C SAMPLING AND SEABED PHOTOGRAPHS AND LOCATIONS



Station: ENV032
Fix: 1551 **E:** 661018 **N:** 6180262 **Depth (m):** 69

Sediment Description:
Soft sediment with shell fragments

Faunal Description:
Faunal turf

Station: ENV032
Fix: 1580 **E:** 661008 **N:** 6180252 **Depth (m):** 69

Sediment Description:
Soft sediment with shell fragments

Faunal Description:
No visible fauna

Overview of Station: ENV032

Key

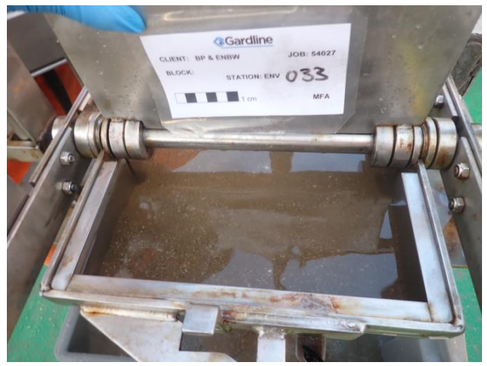
Easting

Station: ENV033
Fix: 1600 **E:** 661237 **N:** 6176297 **Depth (m):** 66

Sediment Description:
Soft sediment with shell hash, some faunal tracks and scattered pebbles



Faunal Description:
Annelida (Serpulidae *stet.*), Bryozoa (Flustridae *stet.*)

Station: ENV033
Fix: 1631 **E:** 661267 **N:** 6176272 **Depth (m):** 66

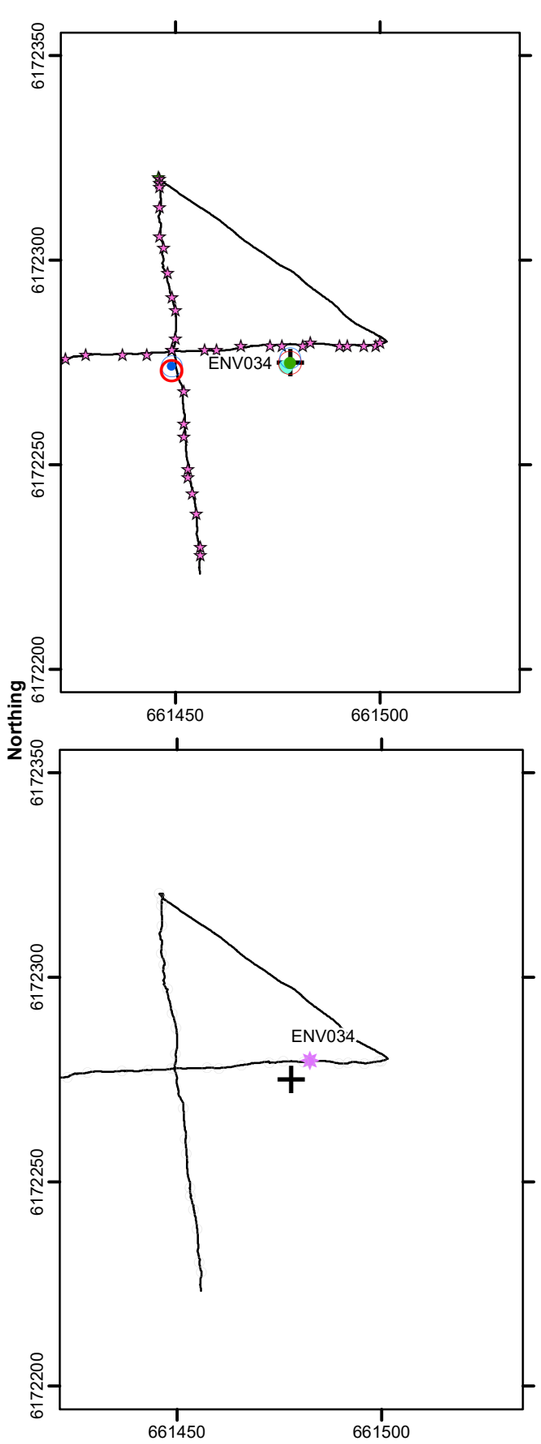
Sediment Description:
Soft sediment

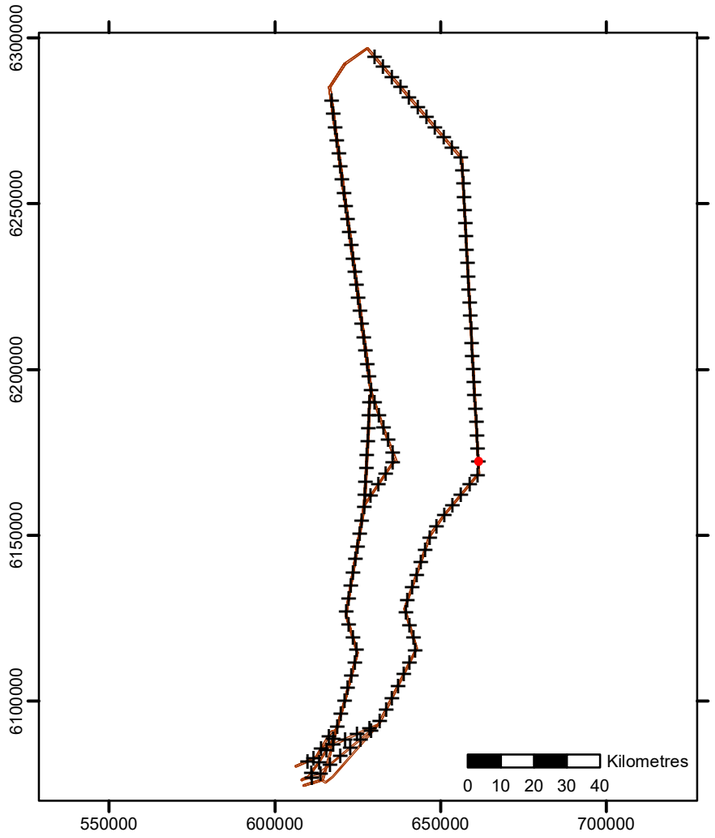
Faunal Description:
No visible fauna

Station: ENV033
Fix: 263 **E:** 661235 **N:** 6176269 **Depth (m):** 69
Retention: MFA

Sediment Description:
Sand with shell fragments

Faunal Description:
Annelida (Polychaeta), Mollusca (Scaphopoda)





Station: ENV033
Fix: 263 **E:** 661235 **N:** 6176269 **Depth (m):** 69
Retention: MFA

Sediment Description:
Sand with shell fragments

Faunal Description:
Annelida (Polychaeta), Mollusca (Scaphopoda)

APPENDIX C SAMPLING AND SEABED PHOTOGRAPHS AND LOCATIONS

Station: ENV034
Fix: 1647 **E:** 661406 **N:** 6172275 **Depth (m):** 64

Sediment Description:
Soft sediment and shell hash

Faunal Description:
No visible fauna

Station: ENV034
Fix: 1670 **E:** 661446 **N:** 6172306 **Depth (m):** 64

Sediment Description:
Soft sediment with shell hash

Faunal Description:
Animalia tube
