Overview of Station: ENV058

Key

- Station Targets
- Morven ECR
- Environmental Camera Transect
- Camera Fix
- Videoframe

Environmental Samples acquired

- Macrofaunal Sample A
- Macrofaunal Sample B
- CHEM Sample 1
- CHEM Sample 2
- PSA
- No Sample

Water Sample Retention

- Fish eDNA - Surface
- Fish eDNA - Seabed
- No Sample

Rocky Reef Resemblance

- Low
- Medium
- No Resemblance

Burrows

- 1-2
- 2-4
- 4-6
- 6-8
- 8-11

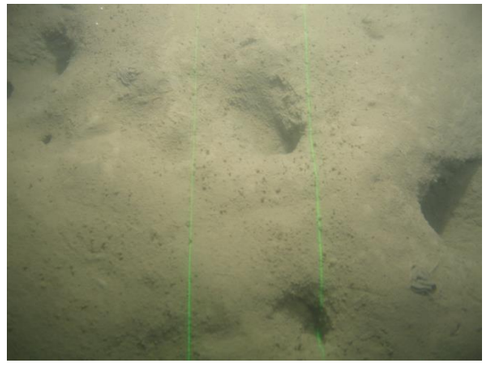
Virgularia stet.

- 1
- 2
- 3
- 4

Pennatula phosphorea

- 1
- 2
- 3
- 4
- 5

Protected Taxa



- *Ammodytidae stet.*
- *Glyptocephalus cynoglossus*
- *Lophius piscatorius*
- *Melanogrammus aeglefinus*
- *Merlangius merlangus*
- *Pleuronectes platessa*
- *Arctica islandica* siphon
- *Modiolus modiolus*

Scale (Unless otherwise stated): Metres

Rippled, soft sediment with shell hash and evidence of bioturbation

Faunal Description:
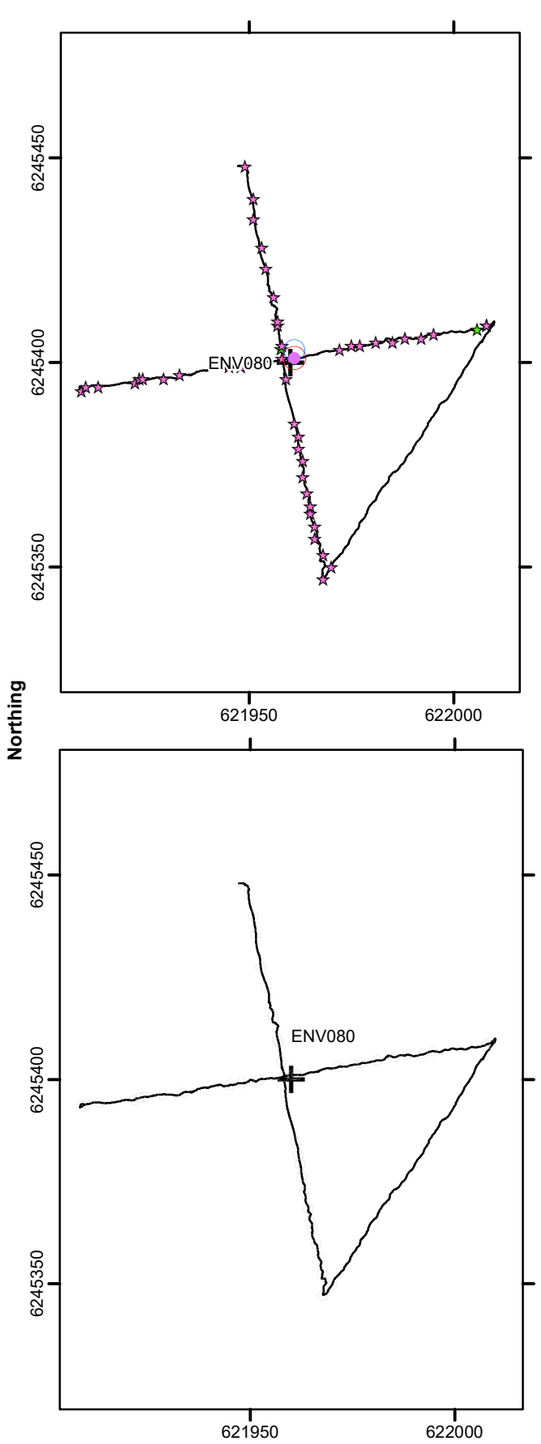
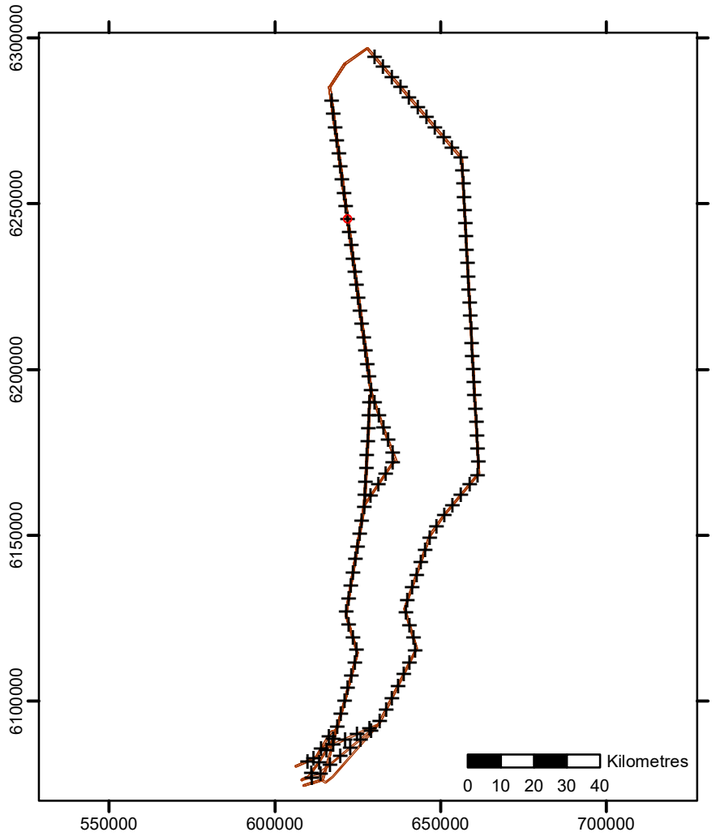
Bryozoa (Flustridae *stet.*), Cnidaria (Hydrozoa *stet.*, *Tubularia indivisa inc*)

Station: ENV079
Fix: 71 **E:** 621429 **N:** 6249278 **Depth (m):** 65
Retention: MFA

Sediment Description:
Fine to medium sand with shell fragments

Faunal Description:
Annelida (Polychaeta), Echinodermata (Ophiuroidea)





Station: ENV079
Fix: 71 **E:** 621429 **N:** 6249278 **Depth (m):** 65
Retention: MFA

Sediment Description:
Fine to medium sand with shell fragments

Faunal Description:
Annelida (Polychaeta), Echinodermata (Ophiuroidea)

APPENDIX C SAMPLING AND SEABED PHOTOGRAPHS AND LOCATIONS

Overview of Station: ENV080

Key

- Station Targets
- Morven ECR

Annelida (Polychaeta), Mollusca (Scaphopoda)

Station: ENV090
Fix: 114 **E:** 627380 **N:** 6205770 **Depth (m):** 66
Retention: MFB

Sediment Description:
Coarse sand with shell fragments

Faunal Description:
Annelida (Polychaeta), Mollusca (Scaphopoda)

APPENDIX C SAMPLING AND SEABED PHOTOGRAPHS AND LOCATIONS

Overview of Station: ENV091

Key

- Station Targets
- Morven ECR
- Environmental Camera Transect
- Camera Fix
- Videoframe

Environmental Samples acquired

- Macrofaunal Sample A
- Macrofaunal Sample B
- CHEM Sample 1
- CHEM Sample 2
- PSA
- No Sample

Water Sample Retention

- Fish eDNA - Surface
- Fish eDNA - Seabed
- No Sample

Rocky Reef Resemblance

- Low
- Medium
- No Resemblance

Burrows

- 1-2
- 2-4
- 4-6
- 6-8
- 8-11

Virgularia stet.

- 1

Animalia tube, Cnidaria (*Pennatula phosphorea inc* GL0087)

Station: ENV101
Fix: 4959 **E:** 634196 **N:** 6178890 **Depth (m):** 87

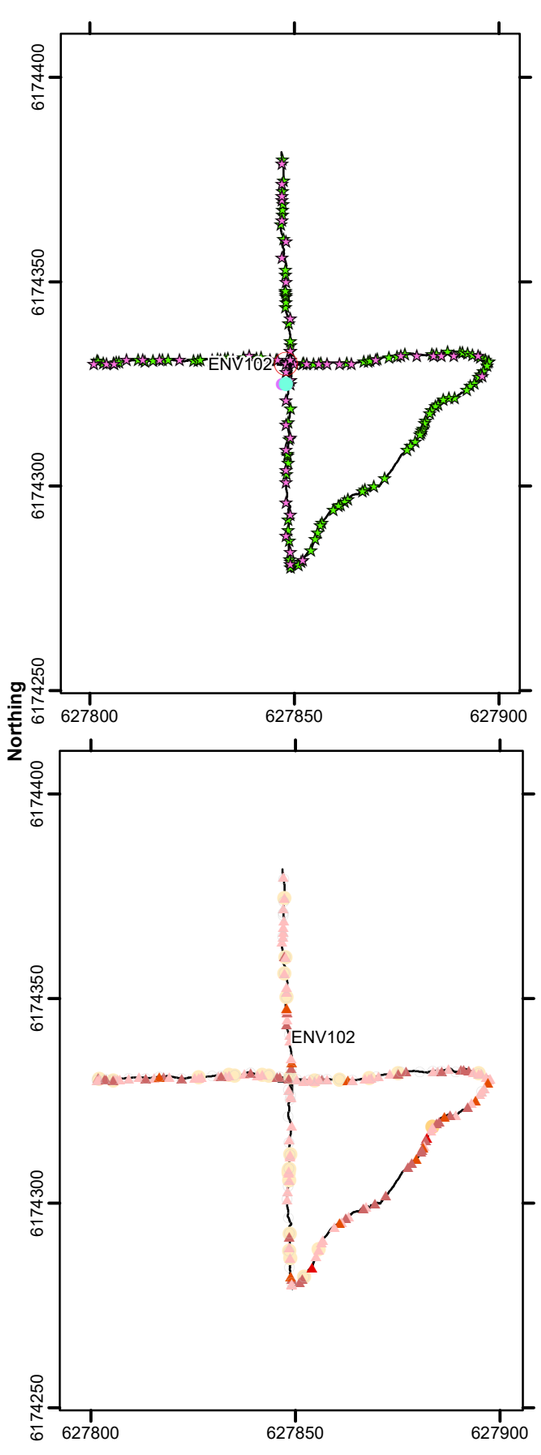
Sediment Description:
Soft sediment

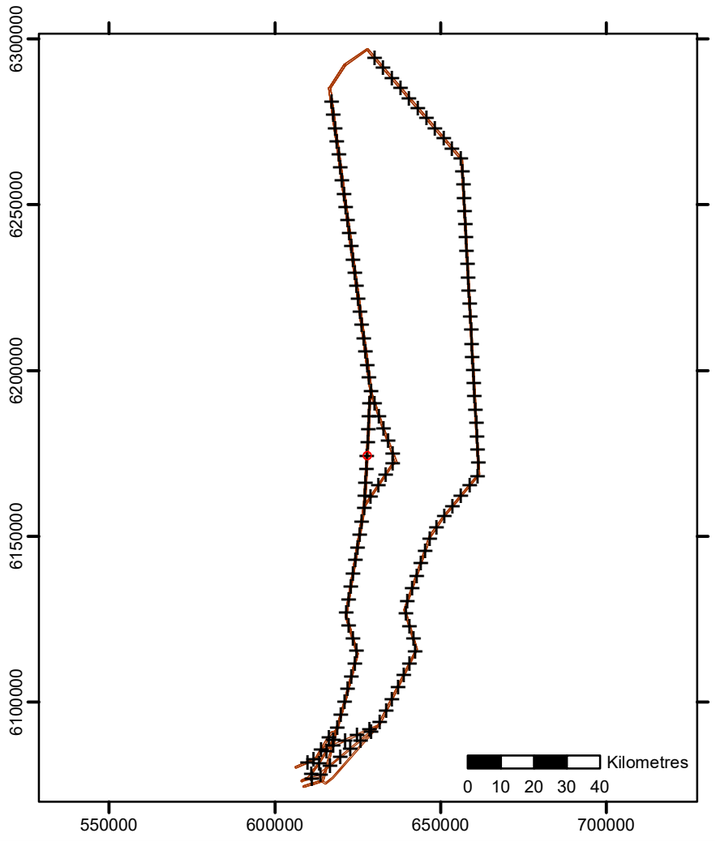
Faunal Description:
Animalia tube

Station: ENV101
Fix: 162 **E:** 634213 **N:** 6178844 **Depth (m):** 90
Retention: MFA

Sediment Description:
Fine sand with shell and shell fragments

Faunal Description:
Annelida (Polychaeta), Echinodermata (Ophiuroidea), Mollusca (Scaphopoda)





Station: ENV101
Fix: 162 **E:** 634213 **N:** 6178844 **Depth (m):** 90
Retention: MFA

Sediment Description:
Fine sand with shell and shell fragments

Faunal Description:
Annelida (Polychaeta), Echinodermata (Ophiuroidea), Mollusca (Scaphopoda)

APPENDIX C SAMPLING AND SEABED PHOTOGRAPHS AND LOCATIONS

Overview of Station: ENV102

Key

- Station Targets
- Morven ECR
- Environmental Camera Transect
- Camera Fix
- Videoframe

Environmental Samples acquired

- Macrofaunal Sample A

APPENDIX D FAUNAL OBSERVATION SUMMARY

APPENDIX D FAUNAL OBSERVATION SUMMARY

Appendix D Faunal Observation Summary can be found in the Excel document entitled:
54027.E4 Morven Habitat Assessment Appendices Rev0

Click here to open/close the attachment pane.

APPENDIX E FAUNAL CATALOGUE

APPENDIX E FAUNAL CATALOGUE

1. Animalia indet

Unidentified fauna burried in the sediment. Pink hue colouration

2. Annelida - Aphrodita aculeata

Large scale worm with irridescent bristles along both sides.

3. Annelida - Hyalinoecia tubicola

Long slender tube resting on the sediment.

4. Annelida - Myxicola stet

Cylindrical worm found emerging from the benthos. Crown of tentacles can be seen with coloured tips either white or black.

APPENDIX E FAUNAL CATALOGUE

5. Annelida - Oxydormus flexuosus

Predatory polychaete worm. Brown in colour with blue/green stripes.

6. Annelida - Serpulidae stet

White calcareous tube, encrusting.

7. Annelida - Terebellidae stet. OTU0148

Very fine feeding tentacles extending from a burrow in the sediment. Unable to identify further due to indistinguishable features.

8. Annelida stet

Long, thin worm. Dark red colouration, protruding from the sediment

APPENDIX E FAUNAL CATALOGUE

9. Arthropoda - Cancer pagurus OTU0118

Large crab with scalloped edge to the carapace. Large stocky claws with black tips.

10. Arthropoda - Caridea stet. OTU0005

Red to pale pink shrimp, white visible on some appendages. Eyes visible in imagery reflecting light. Unable to identify futher than Caridea due to need for physical specimen.

11. Arthropoda - Cirripedia stet. OTU0152

Encrusting barnacles. Lack of distinguishing features to identify further.

12. Arthropoda - Corystes cassivelaunus OTU0111

Carapace longer than it is wide. Large antennae which are positioned together. Males have long pincer arms, up to double the length of the body, whilst females have shorter ones.

APPENDIX E FAUNAL CATALOGUE

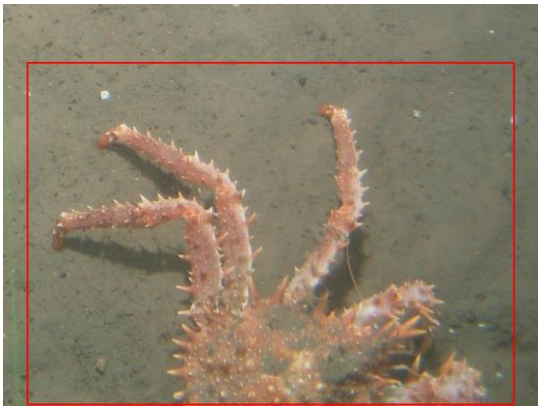
13. Arthropoda - Decapoda stet

Unidentifiable crabs with walking legs, no way to identify further.

14. Arthropoda - Ebalia stet

Diamond shaped carapace, with stocky front chelipeds.

15. Arthropoda - Galatheoidea stet



Squat lobster with large front claws that extend to twice the body length of the crab. Short body and pointed rostrum.

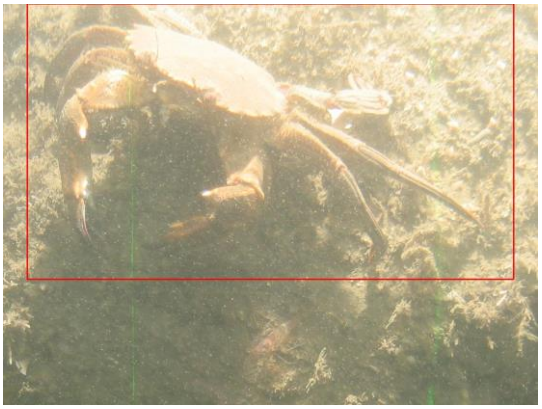
16. Arthropoda - Liocarcinus depurator

Swimming crab with last section of hind legs flattened to form a paddle. The paddle has a purplish hue. Some white dots on the top of the carapace forming a semicircle each side of the shell.

APPENDIX E FAUNAL CATALOGUE

17. Arthropoda - Lithodes maja

Large crab with a well-calcified and almost circular carapace with a well defined rim of irregular spines across the whole surface of the crab. Fifth legs are small and hidden. Shell may be light red to brown. May be hidden under hard substrate.



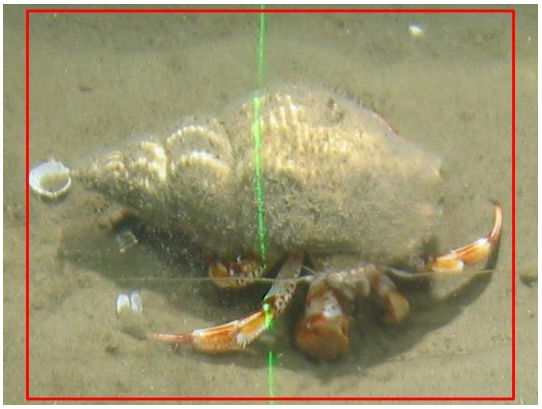
18. Arthropoda - Macropodia stet

Small spider crab with long thin legs. Legs behind the claws are large and often spread wide. Decorated with various fauna to give a fluffy appearance.

19. Arthropoda - Munida rugosa

Squat lobster. Pink to red in colour. Pincers and legs white tipped, with long claws. Water depth indicates rugosa and not sarsi.

20. Arthropoda - Necora puber



Swimming crab with fine velvety texture and red eyes.

APPENDIX E FAUNAL CATALOGUE

21. Arthropoda - Nephrops norvegicus OTU0120

Long, pale orange carapace with long spiny rostrum at the front. Long, slender claws with characterised longitudinal spiny ridges.

22. Arthropoda - Paguroidea stet

Hermit crabs living in gastropod shells. Pale red, pink, orange. Hermit crabs will only be identified to Paguroidea, no further identification is required (except for Pagurus prideaux).

23. Arthropoda - Pagurus prideaux OTU0097

Orange hermit crab. Adults often live in association with the cloak anemone, Calliactis palliata.

24. Arthropoda - Porcellanidae stet

Crab with large claws and flattened body.

APPENDIX E FAUNAL CATALOGUE

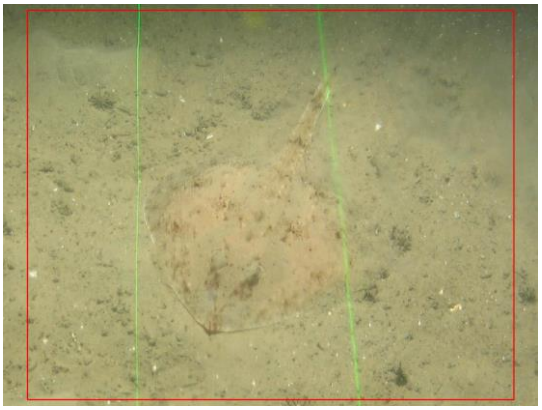
25. Bryozoa - Flustridae stet. OTU0124

Typically a bushy clump with broad lobed fronds. Flustra and Securiflustra not distinguished between.

26. Bryozoa - Reteporella beaniana OTU0010

White lacy looking bryozoa with lattice like folded sheet appearance.

27. Chordata - Actinopterygii indet. 01



Unidentified fish with long, thin, tapering body and large eyes.

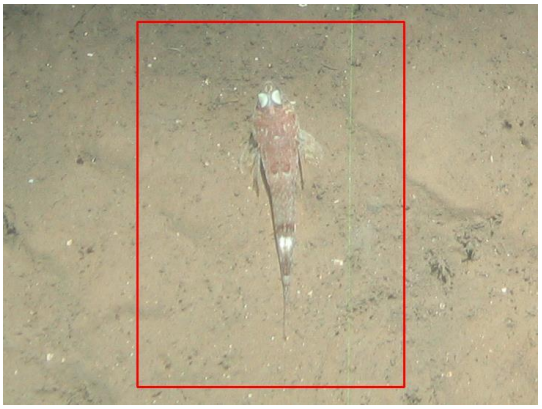
28. Chordata - Agonus cataphractus OTU0006

Dull brown and paler on the back with banding pattern. Covered in hard bony plates

APPENDIX E FAUNAL CATALOGUE

29. Chordata - Amblyraja radiata OTU0129

Rhomboid in shape. Snout short. Tail shorter than disc.Dorsum light brown with irregular scattered dark blotches.



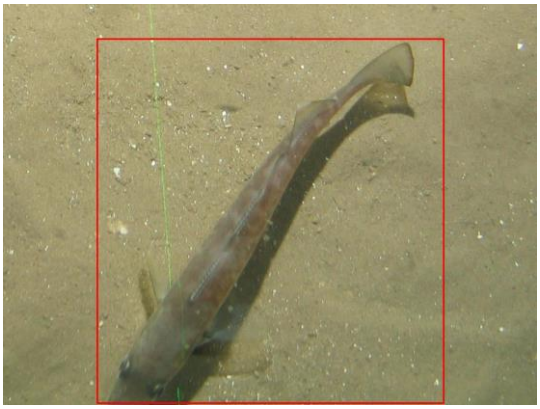
30. Chordata - Ammodytidae stet

Long slender silver fish, pointed snout and small head compared to body. Unable to identify further due to lack of distinguishing features in imagery.

31. Chordata - Ascidiacea indet. 01

Yellow tunicate with two siphons attached to hard substrate.

32. Chordata - Callionymus lyra



Large head and pectoral fins, tapering to a narrow tail. Banding colouration down the body. Eyes on the top of the head.

APPENDIX E FAUNAL CATALOGUE

33. Chordata - Chelidonichthys cuculus

Dark reddish/brown in colour. Three 'fingers' visible infront of the pectoral fins. Shiny lateral line spines visible from above.

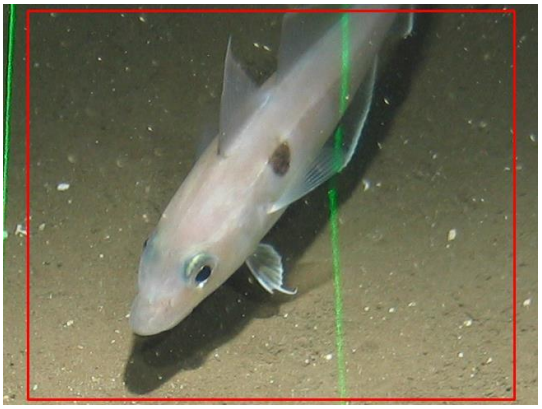
34. Chordata - Gadidae indet. GL0001 OTU0163

Narrow fish with pale colouration. Three dorsal fins visible. Not able to identify further due to a lack of characteristic features

35. Chordata - Glyptocephalus cynoglossus

Right eyed flat fish. Lateral line is relatively straight. Some specimens have black tips to the pectoral fins.

36. Chordata - Lophius piscatorius

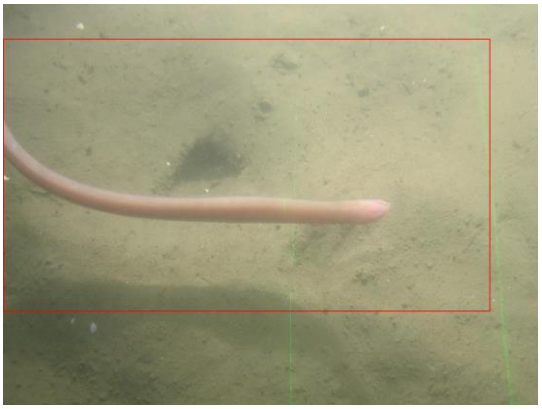


Very large, broad, flat head. Frills around the edge of the mouth and body to aid in camouflage.

APPENDIX E FAUNAL CATALOGUE

37. Chordata - Lotidae stet

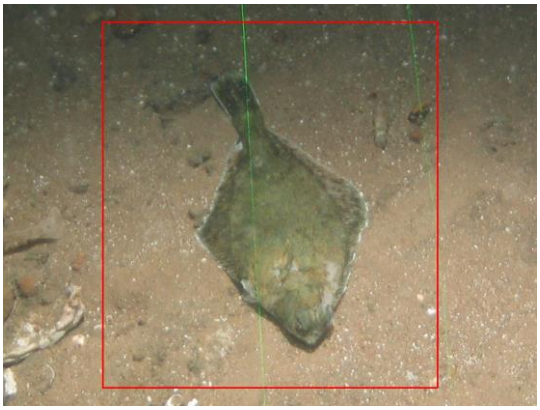
Long slim fish with rounded pectoral fins and a long dorsal fin extending the full length of the body. Large rounded eyes with two barbels. Black spots are dotted along the dorsal fin.



38. Chordata - Melanogrammus aeglefinus OTU0067

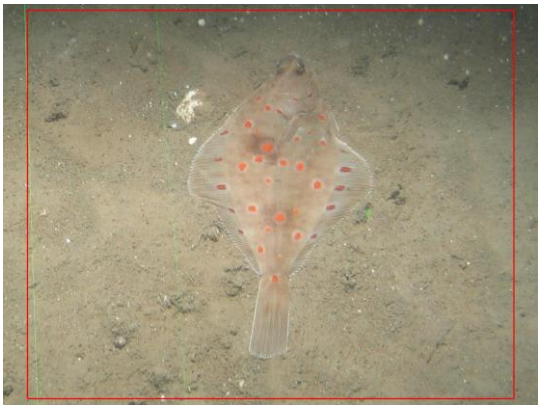
Three dorsal fins with first fin high and pointed. Grey in colour with black dot below the lateral line and behind the pectoral fin.

39. Chordata - Merlangius merlangus



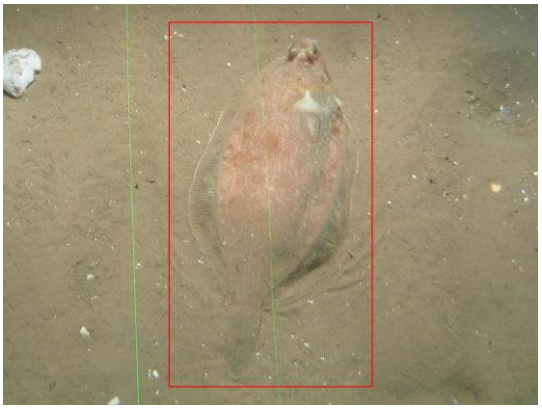
Elongated body with small head and pointed snout. Three dorsal fins and pale pink hue

40. Chordata - Myxine glutinosa OTU0099



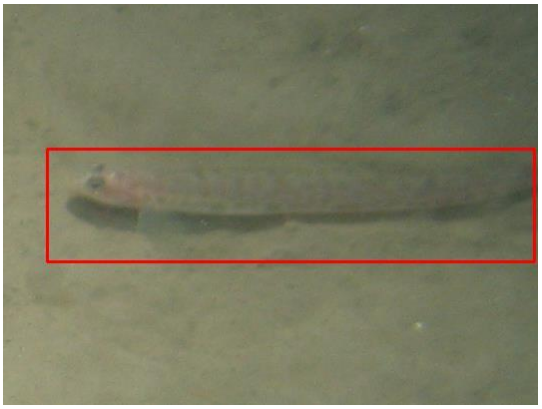
Long slender pale pink to white coloured eel-like fish. These fish may be seen swimming along the benthos or they may be buried in the sediment. May be able to see small barbels around mouth area.

APPENDIX E FAUNAL CATALOGUE



41. Chordata - Platichthys flesus

Right eyed flat fish. Dorsal and anal fins triangular in appearance with rounded edge to the tail. Colour variable.



42. Chordata - Pleuronectes platessa OTU0131

Right-eyed flatfish. Characteristic reddish/brown spots on a brown background.

43. Chordata - Pleuronectiformes stet. OTU0167

Right-eyed flatfish on the sediment. Identifying features not visible.

44. Chordata - Stichaeidae indet. 01

Long slender fish. Mottled colouration, eyes on the top of it's head.

APPENDIX E FAUNAL CATALOGUE

45. Chordata - Triglidae stet

Red/pink fish with large pectoral fins. Square robust head.

46. Cnidaria - Actinaria indet. GL005 OTU0220

Small anemone with short tentacles attached to hard substrate. Pinkish Orange in colour. No further features visible.

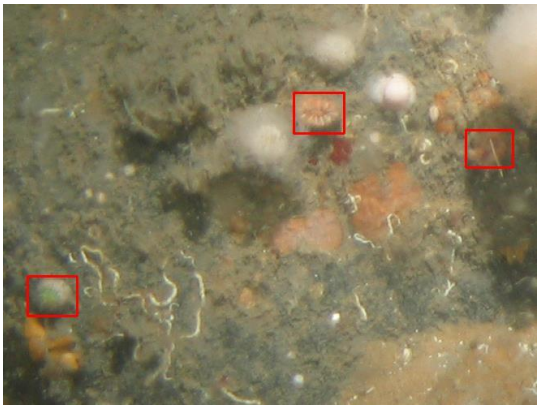
47. Cnidaria - Actinauge richardi

Anemone with large bulbous column and short, often white tentacles. Typically found in muddy sediments, where the base may contain a ball of mud, anchoring it to the seabed.

48. Cnidaria - Actiniaria stet. OTU0158

Anemone with no defining features, tentacles inverted. Unable to identify further.

APPENDIX E FAUNAL CATALOGUE



49. Cnidaria - Alcyonium digitatum OTU0102

Thick fleshy masses of irregular shape, typically of stout, finger-like lobes. Can occur in many colour forms including white or orange but may appear red or brown. Polyps may be retracted giving a leathery appearance or feeding giving a fluffy look.

50. Cnidaria - Calliactis palliata OTU0101

Cloak anemone associated with the hermit crab Pagarus prideaux.

51. Cnidaria - Caryophyllia stet. OTU0243

Cup coral, oval in shape with a zigzag pattern around the mouth. Tentacles not visible.

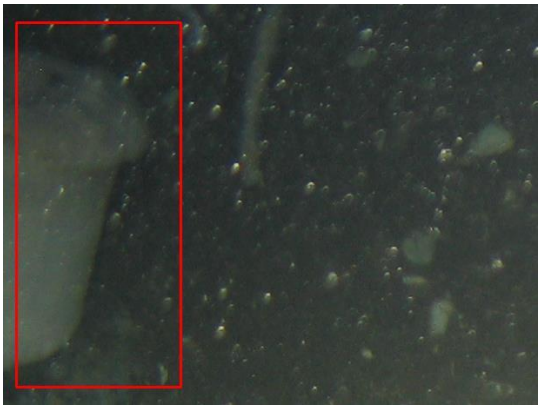
52. Cnidaria - Ceriantharia stet. OTU0024

Tube-dwelling burrowing anemone, thin transparent tentacles.

APPENDIX E FAUNAL CATALOGUE

53. Cnidaria - Epizoanthus papillosus inc. OTU0103

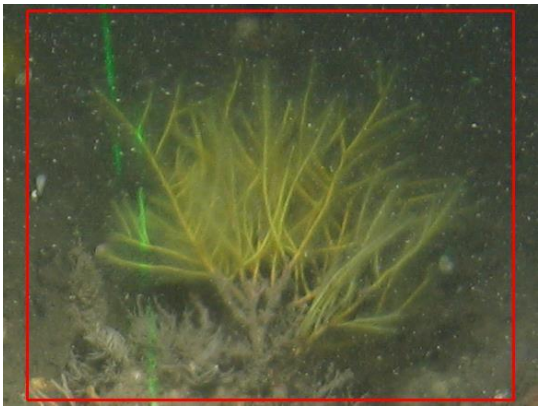
Colonial anemone. Polyps variable in size with column colour blending with the substrate.



54. Cnidaria - Hydractinia echinata inc. OTU0104

Crust or mat growing on a shell, small polyps growing close to the shell, white to pale pink in colour. Often associated with gastropod shells occupied by hermit crabs.

55. Cnidaria - Hydrozoa stet



Dark patches of hydrozoa with a fluffy looking appearance. Seems to be attached at one central point

56. Cnidaria - Metridiidae stet

Long smooth column with dense, plume-like tentacles sometimes partically retracted. Unable to identify further due to difficulty in ID to species.

APPENDIX E FAUNAL CATALOGUE

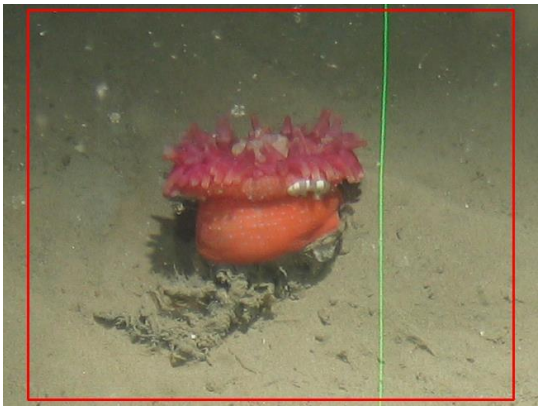
57. Cnidaria - Nemertesia stet

Colonial hydroid with thick erect stems coming from a central point. The stems are typically pale in colour with a fluffy appearance.

58. Cnidaria - Pennatula phosphorea inc. GL0087

Stout red sea pen with white tips shaped like a fleshy feather.

59. Cnidaria - Thuiaria thuja OTU0182



Bottlebrush like hydroid with central stalk and branching and bushy appearance.

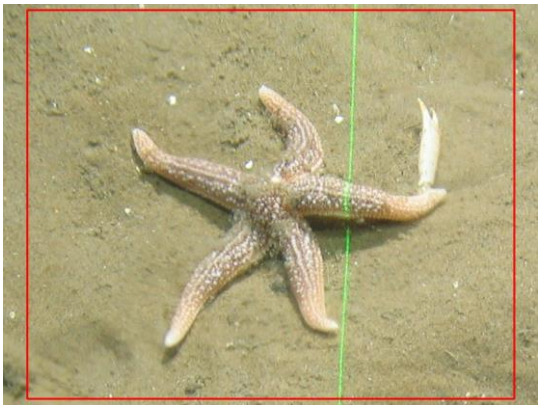
60. Cnidaria - Tubularia indivisa inc

Stemmed hydroids with a polyp at the tip. Tough stem that may cluster together and form a colony base. The polyps are pale pink and consists of a central circlet of tentacles.

APPENDIX E FAUNAL CATALOGUE

61. Cnidaria - Urticina eques OTU0139

Large anemone with short tentacles, sometimes banded. Smooth column without detritus attached.



62. Cnidaria - Urticina stet. OTU0107

Large anemone with short tentacles, sometimes banded. Unable to identify to species due to not being about to see the column.

63. Cnidaria - Virgularia stet. OTU0031

Slender sea pen. Leaves small. Colour off white to creamy yellow. Identification of species from imagery difficult so leave at Genus.

64. Echinodermata - Asterias rubens OTU0088

Five armed starfish with orange colour and white/cream spines on the upper surface.

APPENDIX E FAUNAL CATALOGUE

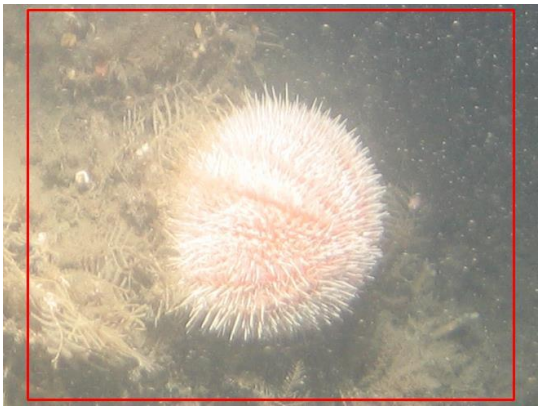
65. Echinodermata - Asteroidea stet

Small starfish. Unable to identify further.

66. Echinodermata - Astropecten irregularis OTU0108

Five armed star fish with short, stocky arms evenly distributed. Pale orange to tan in colour.

67. Echinodermata - Crossaster papposus OTU0219

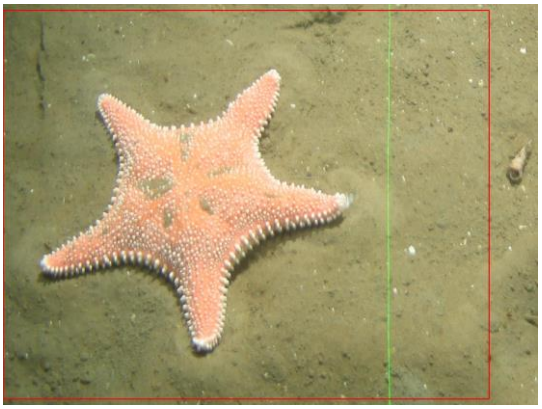


10 to 12 arms around a large central disc. Often highly patterned . Covered in small but visible spines.

68. Echinodermata - Echinocardium cordatum OTU0109

A yellow brown heart shaped urchin with dense spines, mostly directed backwards. Typically buried in soft sediment

APPENDIX E FAUNAL CATALOGUE



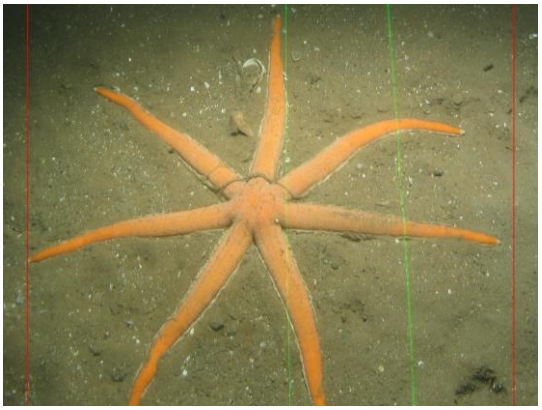
69. Echinodermata - Echinus esculentus inc. OTU0113

Spherical urchin, slightly flattened on the top and bottom. Shell is pink in colouration with white or pink spines.

70. Echinodermata - Henricia stet. OTU0036

Relatively small with five arms. Variety of colours occur: red, yellow, orange, pink. Arm tips may be pointing upwards. Colour variations within a project should not be tagged as separate morphotypes.

71. Echinodermata - Hippasteria phrygiana



Pink starfish with five short arms. white granules cover the upper surface. Arms slightly curve upwards at the tips.

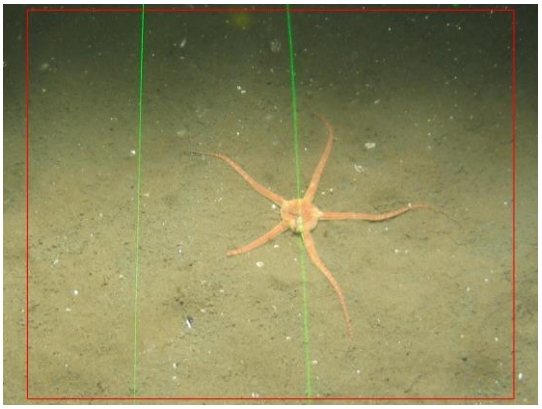
72. Echinodermata - Holothuroidea indet. 01

Vivid red holothurian with short appendages.

APPENDIX E FAUNAL CATALOGUE

73. Echinodermata - Luidia ciliaris OTU0190

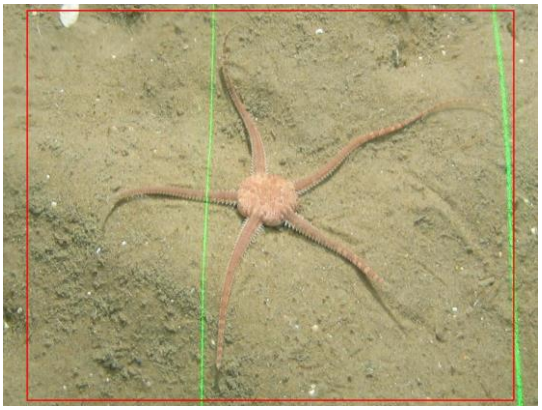
Seven armed starfish. Pale orange in colour, with white spines on the margins of the legs.



74. Echinodermata - Luidia sarsii OTU0090

Starfish with five gently tapering arms and is typically sand coloured or pale orange. This starfish has a band of white marginal spines along each leg.

75. Echinodermata - Ophiothrix fragilis



Central disc is about 1cm across with 5 arms about 5 times as long. The slender tapering arms have 7 spines on each segment giving them a spiky/fluffy appearance. Large range of colours.

76. Echinodermata - Ophiura albida inc. OTU0142

Large central disk with long tapering arms. Bristles extend from the underside of each arm, orange colouration with white spots where to arms join the central disc.

APPENDIX E FAUNAL CATALOGUE

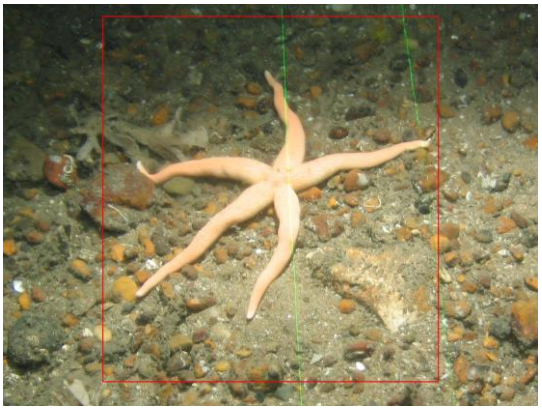
77. Echinodermata - Ophiura ophiura inc. OTU0197

Cicular central disc and thin arms, with orange to pink colouration and bristles visible on the arms near the base.

78. Echinodermata - Ophiuroidea stet

Indistinct brittlestars. Only able to see arms with no distinguising features.

79. Echinodermata - Porania pulvillus



Red cushion star, with short arms, plump stature and velvet like appearance. Usually bright red with soft translucent projections along its back, and cream coloured markings

80. Echinodermata - Spatangus purpureus OTU0173

Large urchin typically found buried in soft sediment. Typical to see a purple colouration with a heary shaped appearance.

APPENDIX E FAUNAL CATALOGUE

81. Echinodermata - Stichastrella rosea

This starfish has five long stiff tapering arms with regular linear pattern of rounded plates on dorsal surface, orange in colour sometimes brighter

82. Faunal turf

Biological material growing on available substrates Indistinguishable between hydrozoa and bryozoa.

83. Mollusca - Arctica islandica - siphon

Orange mantle, two distinct siphons, side by side resembling a pig snout.

84. Mollusca - Bivalvia siphons

Bivalve siphons visible at the sediment surface.

APPENDIX E FAUNAL CATALOGUE

85. Mollusca - Buccinidae stet. 01

Large conical spiralled shell and white foot.

86. Mollusca - eggs

Mollusc eggs with a distinctive ring shape.

87. Mollusca - Gastropoda stet

Poor quality and non descript gastropods.

88. Mollusca - Loliginidae stet

Small squid. Unable to identify further due to image quality.

APPENDIX E FAUNAL CATALOGUE

89. Mollusca - Modiolus modiolus

Dark brown mussel shell with orange flesh often buried in the sediment.

90. Mollusca - Naticidae stet. GL0001 OTU0092

Coiled shell with a large food which when fully extended wraps around a large part of the shelll.

91. Mollusca - Nudibranchia indet. 01

Flat oval nudibranch with pale colouration and a pink middle.

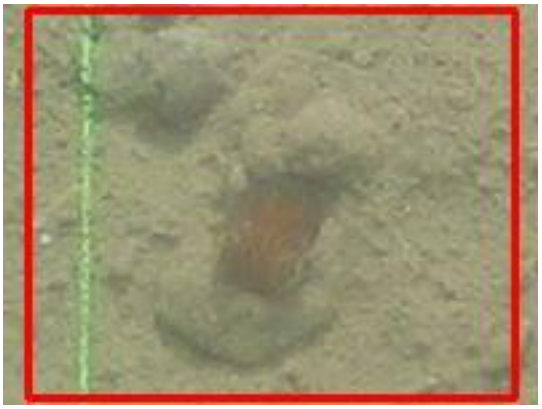
92. Mollusca - Nudibranchia indet. 02

Flat elongated Nudibranch, pink in colour with pink tentacles and white tips

APPENDIX E FAUNAL CATALOGUE

93. Mollusca - Pecten maximus

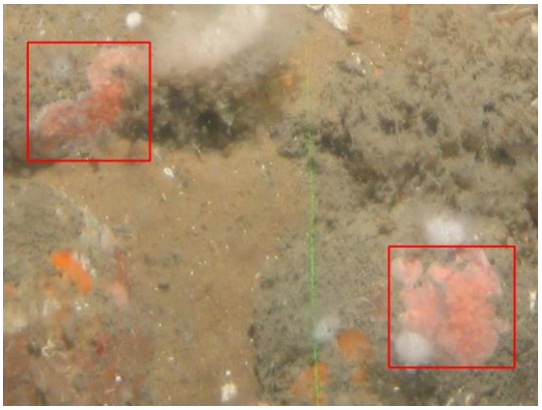
Shell has a very curved outer edge with ribs radiating out from the centre of the hinge. Ridges and hollows of equal size. The 'ears' on the hinge ar of equal size and triangular. When the shell is open, there are long tentacles which may be seen. Adults capable of free-swimming.



94. Mollusca - Pectinidae stet. OTU0136

Scallop with little identifying features. Fan shaped valves with ears on either side of the shell

95. Mollusca - Scaphopoda stet. OTU0093

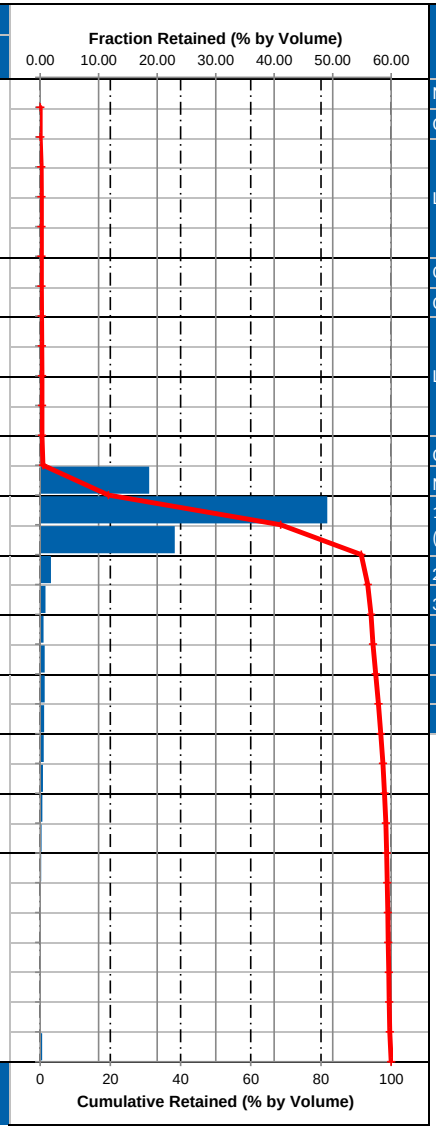


Tusk-shaped white shell typically seen lying on the benthos. Tapering shell with one end thicker than the other and the end of the shell ends with a blunt straight edge.

96. Mollusca - Sepiida stet

Small bobtail squid. Round mantle with eight arms and two tentacles. Large eyes in relation to body size. Often sit on or in sediment.

APPENDIX E FAUNAL CATALOGUE



97. Porifera - Hard Substrate Sponges

Globular rounded sponge with large oscules. Colouration is orange/yellow/brown. Unable to identify further.

EXECUTIVE SUMMARY

During August and September 2024, Gardline conducted a UXO pre-clearance and environmental survey on behalf of Morven Offshore Wind Limited along the proposed Morven Grid Connection 1 (GC1) route (hereafter; the route) from the proposed Morven offshore wind farm to landfall near Sunderland. The offshore survey was conducted onboard the motor vessel (MV) *Ocean Reliance* between 06-Aug-2024 and 21-Aug-2024, with the nearshore survey conducted onboard the MV *Titan Endeavour* between 30-Aug-2024 and 18-Sep-2024.

The aims of the environmental survey were to determine the characteristics of the seabed, benthic and pelagic communities and to identify any environmentally significant species or habitats.

A total of 54 stations were pre-selected along the route. This comprised 8 stations located within the northern area, mostly in Scottish waters, 13 stations in the central area and 33 stations in the southern area, located in English waters. A further 2 stations and 3 video transects were added to the nearshore survey during data acquisition. At all 59 locations drop-down camera data were successfully acquired. Sediment sampling was conducted at 52 stations along the route, of these the required suite of samples, as per the benthic scoping document (Gardline, 2023a), was obtained at 49 stations. All retained samples were acquired using a 0.1m^2 Day grab. Grab samples were acquired approximately every 2 to 4km. Further, water sampling was successfully conducted at all 34 planned stations. Observed water depth varied between 11 and 93m along the route.

Samples for particle size analysis (PSA) were collected at 49 stations along the route. Sediments were heterogeneous, displaying varied particle size distributions, ranging from very poorly to moderately sorted under Folk and Ward (1957). Most stations were classified as muddy sand (n=26; 53%) or sandy mud (n=12; 24%) under the modified Folk (1954), and mean particle diameter ranged between 12 and 927µm. Across the survey area, all stations had a negligible (<5%) gravel (≥2mm) content, except for Stations ENV214 and ENV222 which had 30% and 55% gravel content, respectively and were classified as muddy sandy gravel (Folk, 1954). All stations in the northern and central areas were dominated by sand (≥63µm and <2mm; >72%), whereas fifteen stations in the southern area were dominated (>50%) by sand and twelve were dominated (>50%) by fines (<63µm;silt and clay). Relative to the wider context, sediments along the route were broadly consistent with background for this region of the North Sea (UKOOA, 2001).

Concentrations of total organic carbon (TOC) were ≤0.28% in the northern and central areas and reached a maximum of 5.13% in the southern area other than at Stations ENV221 and ENV200 where significantly higher TOC concentrations of 9.23% and 12.40% were recorded, respectively. A similar spatial trend of variable TOC content along the southern end of the ECR was recorded in the comparison survey (Gardline, 2024b).

Total hydrocarbons (THC) were analysed using ultra-violet fluorescence spectroscopy (UVFS) at 30 stations to meet MMO (2023) guidelines. These THC by UVFS concentrations were ≤2.7µg g^{-1} in the northern and central areas and, correlating with TOC, ranged from 15.5µg g^{-1} at Station ENV186 to 572µg g^{-1} at Station ENV221 within the southern area. At ≥339µg g^{-1}, the THC by UVFS concentrations at four stations in the southern area (Stations ENV222, ENV221, ENV200 and ENV201), exceeded thresholds identified by Mair *et al.* (1987) as sufficient to potentially adversely affect the faunal community.

Additionally, concentrations of THC were analysed by gas chromatography flame ionisation (GC-FID) at four stations located in Scottish waters. These THC by GC-FID concentrations ranged from 2.2µg g^{-1} to 4.5µg g^{-1} with a mean of 3.5µg g^{-1} (±1.0SD), which is consistent with background for central North Sea (CNS) stations over 5km from existing infrastructure as reported by UKOOA (2001).

The MMO (2023) stipulated polycyclic aromatic hydrocarbon (PAH) compounds were analysed at 30 stations. These total PAH concentrations were ≤0.120µg g^{-1} in the northern and central areas. However, in the southern

area, these total PAH concentrations ranged from 1.042µg g^{-1} to 14.468µg g^{-1} and were significantly higher at Stations ENV221 and ENV200, where respective concentrations of 25.420µg g^{-1} and 28.080µg g^{-1} exceeded the ERM value (Long *et al.*, 1995) and may therefore have toxic effects on fauna. The molecular mass indices identified predominantly pyrogenic PAHs at all stations, with potentially mixed sources at Stations ENV201 and ENV237 for the 178 molecular weight index.

The four stations in Scottish waters were additionally analysed by GC mass spectroscopy (GC-MS), with these giving total PAH concentrations of ≤0.012µg g^{-1}. Low naphthalene, phenanthrene and dibenzothiophene (NPD) concentrations across the four Scottish stations further supports the lack of petrogenic contamination along the northern area of the route.

At 30 stations, concentrations of 25 polychlorinated biphenyl (PCB) congeners were analysed by GC-MS-MS with results below the limit of detection (LOD) other than at 17 stations in the southern area of the route. No concentrations exceeded the Cefas Action Level (CAL) 1 or the Long *et al*. (1995) effects range low (ERL) thresholds. The only OSPAR (2009a) Environmental Assessment Criteria (EAC) threshold exceeded was for PCB118 at Station ENV203. Concentrations of PCB118 were similar to those of PCB153, which according to OSPAR (2013) indicates that toxicological effects of PCBs may be apparent.

Following extraction by aqua regia to comply with MMO (2023) specification, metals were directly compared to CALs (MMO, 2023), Buchman (2008) apparent effects thresholds (AETs), Long *et al.* (1995) ERL and effects range median (ERM) values. Arsenic (As), lead, nickel and zinc recorded concentrations exceeding CAL 1 at one or more southern area stations, with no analyte exceeding CAL 2. Following hydrofluoric acid extraction, metal concentrations for the Scottish stations were below the relevant AET and ERL values, with the exception of As at Station ENV179 which was below the ERM. The spatial trend of lower metal concentrations at the northern and central stations, and variable metal concentrations at the southern stations was consistent with the previous survey along the ECR (Gardline, 2024b).

Organotin concentrations were below LOD at sixteen stations along the route. Where organotins were above LOD, no concentrations exceeded the CAL 1 value.

Concentrations of organochloropesticides were below LOD other than at the twenty stations in the southern area of the route. Where CALs were available, only p,p'-Dichlorodiphenyltrichloroethane (DDT) concentrations at Stations ENV205 and ENV221 were above CAL 1. Concentrations of dieldrin and/or p,p'- dichlorodiphenyldichloroethane (TDE) exceeded ERL at seven stations indicating that sensitive species may be impacted.

Analysis of environmental DNA (eDNA) detected a total of 1484 operational taxonomic units (OTUs) comprising 1197 sediment bacterial OTUs, 159 sediment infauna OTUs, 17 sediment fish OTUs, 73 water fish OTUs and 6 marine mammal OTUs. Dominant groups from these respective data sets included Gammaproteobacteria, Polychaeta and Copepoda, Pleuronectidae, Gadidae and Delphinidae and were consistent with those recorded in the comparison survey (Gardline, 2024b). The sediment bacterial community was distinct at nearshore stations in water depths <30m, as was the fish community in water samples from the three shallowest stations.

The macrofaunal analysis recorded 22583 individuals representing 353 taxa and 137.4817g of biomass from the 49 stations sampled along the route. The macrofaunal community was characterised by a dominance of Annelida (Polychaeta) most notably at the stations with muddy sand in the central area, with *Paramphinome jeffreysii* a characterising taxon. At nearshore stations, Mollusca was the more populous group, with *Spisula* a characterising taxon.

With consideration of the particle size analysis and macrofaunal results, the heterogeneous route was classified to three Level 5 EUNIS biotope codes comprising MB5238: *Spisula subtruncata* and *Nephtys hombergii* in Atlantic infralittoral muddy sand at most southern area stations in water depths of <40m, MD6218: *Paramphinome jeffreysii*, *Thyasira spp*. and *Amphiura filiformis* in Atlantic offshore circalittoral sandy mud at central and northern area stations and MD6217: *Levinsenia gracilis* and *Heteromastus filiformis* in Atlantic offshore circalittoral mud and sandy mud across the remaining southern area stations.

GLOSSARY OF TERMS AND ABBREVIATIONS

AET	Apparent Effects Threshold
Aliphatic	An organic compound having open-chain structure (see Alkane)
Alkane	Any of a series of open-chain, saturated hydrocarbons C_nH_{2n+2} (*e.g.* methane, ethane)
α-HCH	alpha-Hexachlorocyclohexane
Anthropogenic	Produced or caused by human activity
BAC	Background Assessment Criteria
BC(s)	Background Concentration(s)
Benthic	Relating to the seabed
β-HCH	beta-Hexachlorocyclohexane
Biogenic	Produced by living organisms
BRC	Background/Reference Concentrations
BSI	British Standards Institute
CAL	Cefas Action Level
CCC	Continuing Calibration Check
CEMP	Coordinated Environmental Management Programme
Clay	Sediment grains <3.9µm in diameter
CM	Central Meridian
CNS	Central North Sea
CPI	Carbon Preference Index
CRM	Certified Reference Materials
DBT	Dibutyltin
DCM	Dichloromethane
DDE	p,p'-Dichlorodiphenyldichloroethylene
DDT	p,p'-Dichlorodiphenyltrichloroethane
DECC	Department of Energy and Climate Change
EAC	Environmental Assessment Criteria
EBS	Environmental Baseline Survey
ECR	Export Cable Route
eDNA	Environmental DNA
EEA	European Environment Agency
ERL	Effects Range Low
ERM	Effects Range Median
EUNIS	European Union Nature Identification System
Fines	Sediment grains <63µm in diameter (same as Mud)
γ-HCH	gamma-Hexachlorocyclohexane
GC	Gas Chromatography
GC1	Grid Connection 1
GC-FID	Gas Chromatography Flame Ionisation Detection
GC-MS	Gas Chromatography Mass Spectrometry
Gravel	Sediment grains >2mm in diameter
HF	Hydrofluoric Acid
HMW	High Molecular Weight
ICP-OES	Inductively Coupled Plasma Optical Emission Spectrometry
ICP-MS	Inductively Coupled Plasma Mass Spectrometry
IUCN	International Union for Conservation of Nature
LAT	Lowest Astronomical Tide
LMW	Low Molecular Weight
LOD	Limit of Detection
Macrofauna	Organisms that are normally larger than the mesh size of the sieve used. In this case 0.5mm.
MBES	Multi-beam Echo Sounder
MBT	Monobutyltin
MDS	Multi Dimensional Scaling
Meiofauna	Organisms that are usually smaller than the mesh size of the sieve used. In this case 0.5mm.
MMO	Marine Management Organisation
Mud	Sediment grains <63µm (includes Silt and Clay)
MV	Motor Vessel
NDIR	Non-dispersive infrared
NOAA	National Oceanic and Atmospheric Administration
NPD	Naphthalenes, phenanthrenes and dibenzothiophenes
NSTA	North Sea Transition Authority
OCPs	Organochloro Pesticides
OSPAR	Oslo and Paris convention
OTU	Operational Taxonomic Unit
PAH(s)	Polycyclic aromatic hydrocarbon(s)
PCBs	Polychlorinated biphenyls
Petrogenic	Relating to unburned petroleum products
PMF	Priority Marine Feature
PRIMER	A statistical analysis program - Plymouth Routines in Multivariate Research
PSA	Particle Size Analysis
Pyrogenic	Produced under conditions involving intense heat
QC	Quality Control
Sand	Sediment grains ≥63µm and <2mm in diameter
SD	Standard deviation
Silt	Sediment grains ≥3.9µm and <63µm in diameter
Sobs	A species accumulation curve with samples added in label order
Sorting	Measure of the range of grain sizes in a sediment sample
SOW	Scope of Work
SSS	Side Scan Sonar
THC	Total Hydrocarbon
TBT	Tributyltin
TDE	p,p'-Dichlorodiphenyldichloroethane
TOC	Total Organic Carbon
TPT	Triphenyltin
TTBT	Tetrabutyltin
UCM	Unresolved Complex Mixture
UGE	A smoothed species accumulation curve based on samples being added randomly and averaged over several runs
UKOOA	United Kingdom Offshore Operators Association
US EPA	United States Environmental Protection Agency
UTM	Universal Transverse Mercator
UVFS	Ultra-violet fluorescence spectroscopy
UXO	Unexploded Ordinance

1 INTRODUCTION

1.1 Scope of Work

Between August and September 2024, Gardline conducted an UXO pre-clearance and environmental survey on behalf of Morven Offshore Wind Limited along the proposed Morven Grid Connection 1 (GC1) route (hereafter; the route) from the proposed Morven offshore windfarm to landfall near Sunderland, in the central North Sea. The offshore survey was conducted onboard the motor vessel (MV) *Ocean Reliance* between 06-Aug-2024 and 21-Aug-2024; while the nearshore survey was conducted on the MV *Titan Endeavour* between 30-Aug-2024 and 18-Aug-2024.

This report presents the results of the environmental baseline survey (EBS). The results of the habitat assessment are summarised where relevant, with full results reported separately (Gardline, 2025).

All positional information in this report is referenced to International 1924 Ellipsoid, European Datum 1950. All grid coordinates are projected using UTM Projection, Grid Zone 30N, CM 3°W.

As detailed in the scopes of work (SOW; bp, 2023; 2024), the objectives of the survey were to complete a site investigation to inform an environmental impact assessment of the route (approximately 265km in length). To do this a multi-disciplinary survey was required. The objectives of the survey included:

- an initial geophysical clearance phase of the route options to complete environmental operations,
- an environmental survey to provide sediment type, benthic characterisation of habitats and species assemblages (including EUNIS biotope determination and physico-chemistry analysis),
- seawater sampling using a Niskin water sampler for eDNA metabarcoding analysis to provide information on species present within the area.

1.2 Environmental Survey Strategy

To enable clear and concise reporting, the naming convention of the stations have been shortened by the removal of the BP24MVEXP-ENV-DC/GS/WS- or MVGC1-ENV-DC/GS/WS- station identifiers. These shortened names have been used throughout this report, though the original full name has been retained in the image file names and on the video overlays. The full and abbreviated names are presented in Table 1.1 along with details of station targets, reason for their selection and data acquired. An overview of the stations is presented spatially in Figure 1.1. The actual positions of the grab samples and seabed imagery, which may be offset from the intended target, are presented in the positional logs in Appendix A with details of sampling methods given in Appendix B. Data acquired at each station is plotted spatially in Appendix C.

To meet the objectives of the SOW, a total of 54 stations were pre-selected along the route. This included 8 stations spaced at approximately 4km intervals along the route within the northern area, mainly in Scottish waters, 13 stations in the central area and 33 stations in the southern area, which were spaced at approximately 2km intervals along the route in English waters. To ensure the route was clear of archaeological artefacts and UXO for the grab sampling operations, MBES, magnetometer and SSS reconnaissance lines were run over each station target. Stations were adjusted in the field to avoid seabed hazards and other obstructions.

Stations ENV236 and ENV237 were added during the nearshore survey following receiving sampling approval from Historic England. Three additional camera-only transects were added (Stations ENV238, ENV239 and ENV240) during the nearshore survey to investigate an area of potential stony reef habitat.

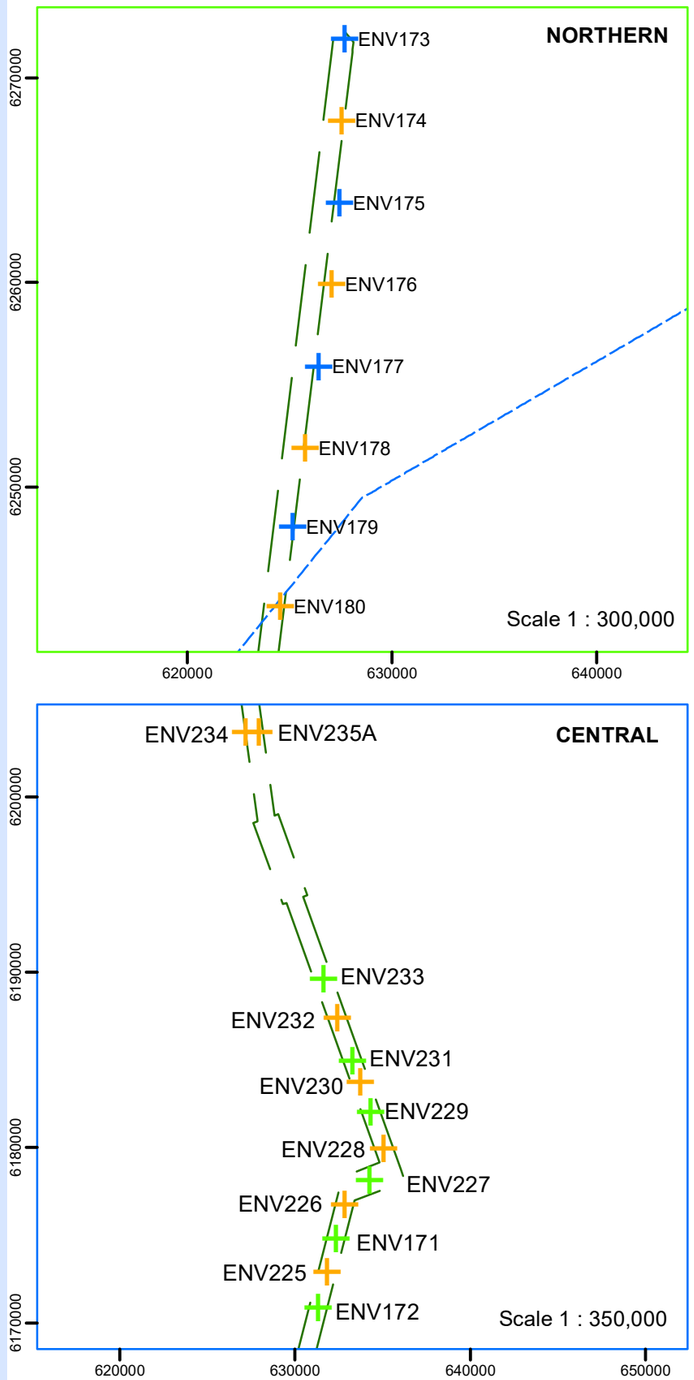
Following acquisition of Station ENV235, it was determined the positioning of the station was outside the route boundary; therefore, sampling was reacquired as Station ENV235A, with no further analysis of the data from Station ENV235.

At all 59 stations, drop-down camera data were successfully acquired. As per the SOW (bp, 2023; 2024), all camera tracks were no more than 305m in length.

A minimum of three grab samples were proposed every 2 to 4km using a 0.1m^2 Day grab for analysis of particle size, environmental DNA (eDNA) and macrofaunal community. An additional sample was acquired at 30 stations for chemical analysis and fish eDNA. Following several unsuccessful grab sampling attempts likely attributed to coarse sediments, three stations (Station ENV183, ENV197 and ENV198) were abandoned. Similarly, sampling was not attempted at four stations (Stations ENV182, ENV188, ENV199 and ENV219) after review of the seabed imagery due to the presence of cobbles and boulders.

Water samples for eDNA analysis were successfully acquired at all 34 planned stations.

Table 1.1 Summary of Environmental Sampling Positions and Samples Acquired



Area	Client ID	Name in this Report	Camera Acquisition Type	Target Easting[1]	Target Northing[1]	Stations Selection	Data Acquired

1 Environmental target locations; actual camera track and sampling positions for each individual grab and water sample are detailed in Appendix A.
2 One macrofauna sample was sent to be analysed and the other kept as a spare at room temperature. Analysis methods are as detailed in Appendix B.
3 Sub-samples were collected from sediment grab samples unless otherwise specified (e.g., (water)).
4 Grey number indicates sediment eDNA sample collected but not analysed
5 Where available and relevant, up to three spare sediment sub-samples were stored in a glass jar and available for hydrocarbon and MMO chemistry analysis and up to four sediment sub-samples were each stored in a double-lined zip-lock bag and available for analysis of metals, particle size, sediment eDNA and fish eDNA. Analysis methods are as detailed in Appendix B.
6 Bacterial filter were used instead of standard filters for one or both of these samples.

1.3 Comparison Data

Where possible the results obtained from the current survey were compared to the findings of the previous survey undertaken along the Morven Export Cable Route (ECR) by Gardline (2024b).

For the current and comparison survey (Gardline, 2024b) particle size analysis (PSA) was undertaken using wet and dry sieving with the <1mm fraction analysed by laser diffraction particle sizer. No dispersants were used and the sediments were not treated to remove the organic fraction prior to analysis. The PSA statistics were calculated using Folk and Ward (1957). In the current and comparison survey, total organic carbon (TOC) was analysed following inorganic carbon removal with acid by induction, fitted with a non-dispersive infrared (NDIR) cell.

Methods conducted to MMO (2023) specification (hydrocarbons and metals) were comparable for a group of 30 stations in the current survey and 66 stations from the comparison survey (2024b). Total hydrocarbons (THC; MMO, 2023) were ultrasonically extracted followed by analysis using ultra-violet fluorescence screening (UVFS) with polycyclic aromatic hydrocarbons (PAHs) extracted by dichloromethane (DCM) solvent extraction, followed by gas chromatography mass spectrometry (GC-MS).

For the four stations located in Scottish waters, which were comparable to a group of eleven stations in the comparison survey, hydrocarbons were extracted using DCM solvent extraction followed by analysis with gas chromatography flame ionisation detection (GC-FID) for THC concentrations and aliphatic (n-alkanes) fractions. N-alkanes are reported between nC_{10} to nC_{37} for both surveys and GC-MS was used for the determination of the PAH fractions.

The analyses of polychlorinated biphenyls (PCBs) and organochloropesticides (OCPs) were by ultrasonic solvent extraction followed by gas chromatography tandem mass spectrometry (GC-MS-MS) for both the current and comparison survey (Gardline, 2024b), while organotins were analysed following hydrochloric acid and methanol digest.

For the 30 stations in the current survey and 66 stations from the comparison survey (Gardline, 2024b), analysis methods for arsenic (As), cadmium (Cd), chromium (Cr), copper (Cu), mercury (Hg), nickel (Ni), lead (Pb) and zinc (Zn) involved extraction by aqua regia followed by analysis using an inductively coupled plasma mass spectrometer (ICP-MS).

For the four stations in Scottish waters from the current survey and eleven stations from the comparison survey (Gardline, 2024b), analysis methods for As, barium (Ba), Cd, Cr, Cu, Hg, Ni, Pb, vanadium (V) and Zn involved hydrofluoric (HF) acid extraction followed by subsequent analysis using an ICP-MS or inductively coupled plasma optical emission spectrometry (ICP-OES) in the case of Ba.

Faunal samples in the current and comparison survey were screened through a 0.5mm sieve prior to analysis with separate sediment eDNA sub-samples acquired for metabarcoding.

In both the current and comparison survey, water eDNA samples were also acquired for metabarcoding.

Table 1.2 Details of Comparable Survey

Survey reference	Current Survey	54027 Gardline (2024b)
Survey date	Aug to Sep-2024	Jun to Nov 2023
Survey type and number of stations	EBS site, 54 stations PSA at 49 stations MMO chemistry at 30 stations Additional chemistry at 4 stations Sediment eDNA at 30 stations Fish eDNA at 30 stations Water eDNA at 34 stations	EBS, 133 Stations PSA at 128 stations MMO chemistry at 66 stations Additional chemistry at 11 stations Sediment eDNA at 65 stations Fish eDNA at 56 stations Water eDNA at 68 stations
Predominant sediment type[1]	Muddy sand (very fine to medium) to muddy sandy gravel (pebble) Sand (fine to medium) Sandy mud (fine silt to very fine sand)	Muddy sand (very fine to medium) to gravelly muddy sand Sand (fine to coarse) to sandy gravel (granule) Sandy mud (coarse silt to very fine sand) to gravelly mud
Water depth (m LAT) sampled	11m to 93m	24 to 104m
Comparison data available	*MMO Specification* • PSA (Folk and Ward sorting) • TOC by induction furnace (FOC) • PCBs and OCPs by ultrasonic solvent extraction and GC-MS-MS • Organotins by hydrochloric acid and methanol digest • THC by UVFS • PAH by solvent extraction and GC-MS • Metals – As, Cd, Cr, Cu, Hg, Ni, Pb, Zn by aqua regia extraction followed by ICP-MS analysis • Macrofauna 0.5mm mesh size • eDNA analysis of sediment and water *Additional Analysis – Scottish Stations only* • THC/PAH by wet vortex extraction and GC (THC prior to fractionation) • Metals – As, Ba, Cd, Cr, Cu, Hg, Ni, Pb, V and Zn by HF extraction	As per current survey

1 Predominant seabed type according to the modified Folk classification (with the Wentworth classification of mode grain size in parenthesis).

1.4 Published Background Data

Reference, where possible, has been made to suitable published background data for marine sediments from the North-East Atlantic and North Sea such as Cefas Action Levels (CALs; MMO, 2023), UKOOA (2001) and OSPAR (2005), along with toxicity information including effects range low (ERL) and effects range median (ERM; Long *et al.*, 1995) and the apparent effects thresholds (AETs) as detailed by Buchman (2008). Background information is also provided in Appendix D.

The MMO (2023) CALs are used to assess dredging material and its suitability for disposal at sea. The values can be used in conjunction with other assessment methods to monitor the contaminant levels of metals, organotins, PAHs and PCBs. In general, contaminant levels in dredged material below CAL 1 are of no concern and are unlikely to influence the licencing decision. Dredged material with contamination levels between CAL 1 and CAL 2 would require further consideration and testing before a decision can be made. Dredged material with contamination levels above CAL 2 is generally considered unsuitable for sea disposal.

The UKOOA commissioned an analysis of seabed environmental surveys carried out on behalf of UK North Sea offshore oil operators. The purpose of these surveys was to monitor the seabed in the vicinity of offshore operations with the aim of detecting environmental impact. The analysis was completed in three phases. Phase 1 consisted of the compilation of an inventory of surveys carried out in the UK sector. This initially summarised the results of 472 environmental surveys carried out between 1975 and 1998 by environmental monitoring contractors, government agencies and universities. Background contaminant levels were recorded in three different sectors of the North Sea and the presence of oil installation clusters situated successively further north allowed the region to be separated into northern (north of latitude 60°N), central (between latitudes 55°N and 60°N) and southern (south of latitude 55°N) sectors. Phase 2 involved the production of database files containing detailed biological, chemical and location data. Phase 3 examined the extent of contamination from offshore exploration and production activities and impacts on the biota and attempted to determine any large-scale trends over wider geographical areas. This final phase was completed in April 2001. Care was taken to record the database in a format that ensures the contaminant concentrations measured by different analytical methods are kept separate. UKOOA (2001) background reference concentrations were averaged from stations >5km from the nearest platform in each of the three sections of the North Sea, with hydrocarbon concentrations determined by gas chromatography (GC) and metal concentrations as given by sodium fusion or similar extraction methods. Mean data and 95th percentiles are available; the latter representing the threshold, which 95% of stations recorded a concentration below. Although the majority of the stations in the southern area were located just south of latitude 55°N, comparison and reference are made throughout this report to findings from the published report (UKOOA, 2001) with reference to the UKOOA defined central North Sea sector, with reference to specific subsets of stations with sandy, silt and clay, muddy sand and fine sand sediment where relevant.

A set of background concentrations (BC) published by OSPAR (2005), represent the concentrations of certain hazardous substances that would be expected in the North-East Atlantic if certain industrial developments had not happened. OSPAR has also described background assessment criteria (BACs), a set of statistical tools that enable testing of whether mean observed concentrations (*i.e.* collected during a seabed survey) can be near background concentrations. Where no updated BCs have been developed, the upper limit of the range of background/reference concentrations (BRC) have been used. Comparison to OSPAR (2005) data required normalisation of the hydrocarbon concentrations to 2.5% TOC. However, OSPAR (2015) acknowledge that the current BC and BAC may be inappropriate for application throughout the Convention area, as they were derived from a data set that emphasises the northern part of the Convention area and within other areas there may be differences in origin and composition of the sediment. OSPAR (2015) point out that if the composition of the sampled sediments is very different to the sediment type defined for the assessment criteria, normalisation will require a large extrapolation and may cause an unacceptable uncertainty. As such, where OSPAR (2005) BC,

BAC and BRC values are compared with predominantly sandy or coarse sediments, particularly in the southern part of the convention area, interpretation should be treated with some caution.

The best estimates of the potential toxicity of PAHs in marine sediments are ERL and ERM concentrations for total low molecular weight (2- to 3-ring, LMW), total high molecular weight (4- to 6-ring, HMW) and total 2-6 ring PAHs (Neff, 2004) as given by Long *et al.* (1995) and OSPAR (2009c). These concentrations are not actual thresholds of toxicity but delineate concentration ranges with associated probabilities of toxicity. More information on the ERL and ERM for PAHs can be found in Appendix D. Long *et al.* (1995) also define ERL and ERM values for selected metals.

Environmental Assessment Criteria (EAC) for PAHs, PCBs and the metals Cd, Hg and Pb were defined by OSPAR as part of their Coordinated Environmental Management Programme (CEMP; OSPAR, 2009c). The EACs represent the contaminant concentration in the environment below which no chronic effects are expected to occur in marine species, including the most sensitive species. Therefore, concentrations below the EACs are considered to present no significant risk to the environment. EACs for a range of contaminants were proposed in 2004 and updated EACs for polychlorinated biphenyls (PCBs) were proposed in 2008. Further EACs continue to be developed for use in data assessments. Comparison with EACs required normalisation of PAH and PCB concentrations to 2.5% TOC and metals to 1% TOC. Where EACs are not available, OSPAR instead advise using the afore mentioned ERL and ERM values.

Buchman's (2008) AETs were obtained by establishing relationships between the sediment metal concentrations and benthic community toxicological impacts and correspond to the highest concentrations at which no toxicological effects were observed.

1.5 Existing Infrastructure

Based on data from NSTA (2023) there is no existing infrastructure within 5km of the route.

2 RESULTS AND DISCUSSION

2.1 Geophysical Survey Summary

2.1.1 Survey Overview

The survey area along the route was divided up into three areas: a northern, central and southern area. To provide clearance from potential UXO and other obstructions, MBES, SSS and magnetometer data were acquired over all target environmental sampling locations. These data were for UXO pre-clearance only; therefore, no further interpretation or analysis of the data was conducted onshore.

2.2 Seabed Imagery Observations Summary

Seabed imagery acquired with a digital camera system at 56 stations and 3 transects was analysed. Results are summarised below, with full details of the habitat assessment reported separately (Gardline, 2025). A selection of seabed photographs, together with descriptions and positions, are presented in Appendix C.

Overall, 38% of useable stills contained visible fauna, and similarly sparse fauna was recorded in the comparison survey (Gardline, 2024a). The sparsity in the current survey was most notable in the northern area where only 26% of useable stills contained visible fauna, whereas almost half (45%) of useable stills from the central area contained visible fauna.

Along the route the most frequently observed taxa and/or features were;

- burrows, present at 29 stations from the central and southern areas and in 13% of usable stills,
- faunal turf, present at 25 stations and in 10% of usable stills, mainly from the southern area,
- *Alcyonium digitatum,* present at 33 stations from the northern and southern areas and in 9% of useable stills,
- *Pennatula phosphorea,* present at 11 stations in the central area and in 6% of useable stills.

These were consistent with the most frequently observed taxa in the comparison survey (Gardline, 2025).

A total of 576 burrows were recorded in the imagery across 29 stations, with densities ranging from 0.05 burrows m^{-2} at Station ENV172 to 8.15 burrows m^{-2} at Station ENV224. In accordance with the SACFOR scale (JNCC, 2013), burrow densities were classified within a range that encompassed frequent at 23 stations; all of which were in English waters. Further, burrowing fauna was rarely sighted with only seven individuals of *Nephrops norvegicus* observed across the survey area; therefore; burrows could not be confidently attributed to any of the classified megafauna species within the sea pen and burrowing megafauna communities habitat classification.

A total of 210 sea pen individuals comprising 188 individuals of *P. phosphorea* and 22 individuals of *Virgularia* were observed across 15 stations. In accordance with SACFOR, where observed, *P. phosphorea* were classified in a range that encompassed frequent at 10 stations, whilst *Virgularia* encompassed frequent at 3 stations. In accordance with SACFOR and the JNCC clarification report (2014), 5 stations (ENV187, ENV210 to ENV212 and ENV230) could be considered as showing the greatest similarity to a sea pen and burrowing megafauna communities habitat in that burrows encompassed the SACFOR ranges frequent to common.

Whilst this habitat is on the OSPAR (2008) list of threatened and/or declining species and habitats, it is widespread throughout the central North Sea, around the south and west coasts of Norway and around the north of the British Isles (OSPAR, 2010; Hill *et al.*, 2022). This habitat is also listed as a component biotope of the burrowed mud habitat which is a priority marine feature (PMF; NatureScot, 2020); however, no burrows were observed at any station in Scottish waters.

Areas of cobbles and boulders were noted during imagery analysis. As such stations were reviewed for their resemblance to a stony reef habitat based on the criteria adopted by Irving (2009). A total of twelve stations were observed to be matrix supported with three stations (ENV182, ENV188 and ENV240) predominantly clast supported. Following analysis, nine stations (ENV183, ENV197 to ENV200, ENV203, ENV205, ENV218 and ENV239) showed low resemblance to a stony reef, with a further six stations (ENV182, ENV188, ENV204, ENV219, ENV238 and ENV240) showing a medium resemblance.

A total of eight pairs of siphons, thought to be the bivalve *Arctica islandica*, were observed in imagery across three stations (ENV174, ENV175 and ENV178). This species is on the OSPAR (2008) list of threatened and/or declining species and habitats. In addition, it is listed as a low or limited mobility species PMF in Scottish offshore waters (NatureScot, 2020); however, this species is commonly found within this area of the North Sea.

A total of fifteen individuals of witch flounder (*Glyptocephalus cynoglossus*) were observed across twelve stations. This species is classified as vulnerable on the IUCN Red List (2025).

Two individuals of angler fish (*Lophius piscatorius*) were observed in imagery across two stations in English waters. This species is listed on the UK Post-2010 Biodiversity Framework (JNCC and Defra, 2012) as a priority species.

Sixteen individuals of plaice (*Pleuronectes platessa*) were observed in imagery across nine stations. This species is classified as a priority species under the UK Post-2010 Biodiversity Framework (JNCC and Defra, 2012) and is listed on the Scottish Biodiversity List (NatureScot, 2020).

A total of thirty-five individuals of the urchin *Echinus esculentus* were identified across seven stations. This species is listed as near threatened on the Global Red List (IUCN, 2024).

Other than those habitats and species detailed above and in Section 2.4.1, there was no further evidence from the seabed imagery of any habitats listed under Annex I of the Habitats Directive (1992), habitats or species classified as features of conservation importance under the Marine Environment Regulations (2018), species or habitats selected as PMFs (NatureScot, 2020), species listed on the Scottish Biodiversity List (NatureScot, 2020), species or habitats on the OSPAR (2008) list of threatened and/or declining species and habitats or species on the IUCN (2025) Global Red List of threatened species.

2.3 Sediment Sampling Summary

Sediment sampling was conducted at 52 stations along the route, with the required suite of samples collected at 49 stations as per the SOW (bp, 2023; 2024). All successful samples were acquired using a 0.1m^2 Day grab. Environmental deck and positioning logs are presented in Appendix A, with example images presented in Appendix C.

Of the 52 stations, sampling was attempted at the Stations ENV197, ENV198 and ENV183 but was abandoned after multiple sampling attempts, likely due to the presence of cobbles. The grabs at these stations frequently did not trigger and gravel was commonly found in the jaws of the grab. Sampling was not attempted at Stations ENV182, ENV188, ENV199 and ENV219 due to the observation of cobbles and boulders during seabed imagery which would have impacted sampling attempts.

Excluding sampling at the superseded Station ENV235, a total of 177 grab samples were acquired from 215 attempts (82% success rate). Of these retained samples, 99% were acquired within 10m of the target location and the remaining sample (from nearshore Station ENV200) was acquired 20m from the target. On average,

samples were obtained within 1.6m of their target location (±1.8SD). The 38 unsuccessful sampling attempts occurred across 18 stations, most of which were from the southern area. Samples were largely rejected due to low sample retention, stones in the grab jaws and misfiring of the grab associated with coarse sediments, other than at Station ENV226 in the central area, where the presence of Myxinidae resulted in sample rejection.

Seabed sampling supported the initial interpretation of the seabed imagery findings at these stations, confirming that the seabed comprised sandy sediment with varying amounts of fines, shell fragments and occasional areas of muddy sediment with cobbles; the latter being restricted to stations in the southern area.

Visible fauna observed within the retrieved grab were limited and included:

- Annelida (Polychaeta)
- Arthropoda (Brachyura, Crustacea, Corystidae, Paguroidea)
- Cnidaria (Alcyoniidae, Pennatuloidea)
- Echinodermata (Echinoidea, Ophiuroidea, Spatangoidea)
- Mollusca (Bivalvia, Gastropoda, Pharidae, Scaphopoda)

2.4 Sediment Characteristics

2.4.1 Particle Size Analysis

The results of the PSA, determined by wet and dry sieving and laser diffraction, are summarised in Table 2.1, along with comparable and published data. Full results, including histograms illustrating the particle size distribution at each of the 49 sampled stations, are presented in Appendix E. The results of the PSA were consistent with observations from geophysical reconnaissance data, seabed imagery and the recovered sediment samples.

Along the route, sediments were heterogenous, with particle size distributions ranging from very poor to moderately sorted under Folk & Ward (1957). Mean particle diameter varied from 12µm at Station ENV215 to 927µm at neighbouring Station ENV214, which are sizes described under Wentworth classification (1922) as fine silt to coarse sand. Excluding two significant outlier stations in the southern area (Grubbs' $p<0.01$, Appendix F; Stations ENV214 and ENV222), the mean particle diameter was ≤341µm along the route.

Of the 49 stations where PSA was collected, all stations had negligible (<5%) gravel (>2µm) content, except for the two outlier stations (Grubbs' $p<0.01$, Appendix F; Stations ENV214 and ENV222) which had 30.2% and 54.6% gravel content, respectively. All stations in the northern and central areas were dominated by sand (≥63µm and <2mm; >72%). Of the stations located in the southern area, fifteen were dominated by sand (>50%), while a further twelve stations were dominated by fines (>50%; <63µm; silt and clay).

Most stations recorded poorly to very poorly sorted sediment (n=44, 90%) with fine slewed distributions (fine to very fine skewness; n=43, 88%). When classified under the modified Folk (1954) sediments were predominantly muddy sand (n=26; 53%) or sandy mud (n=12; 24%) and these stations recorded modal phi values between 1.5 and 7.0 (Appendix E).

The sediments along the route were broadly consistent with those recorded in the comparison survey conducted along the ECR (Gardline, 2024b). Both surveys had a wide range of grain diameters with sediments in the northern area of the route containing higher proportions of sand whereas those in the southern area of the route exhibited higher proportions of fines, likely due to the proximity to the coastline and major riverine systems, as illustrated in Figure 2.1.

The mean grain size and fines content as presented by UKOOA (2001) for stations over 5km from existing infrastructure in the central North Sea (between latitudes 55°N and 60°N), sampled between 1975 and 1995 (hereafter referred to as background stations) are presented in Table 2.1. Relative to the wider context, sediments along the route were broadly consistent with background levels, with only Station ENV215 recording sediment notably finer.

The stations along the route coincide with a potential herring nursery ground (Ellis *et al.*, 2012). The results of the analysis, (Gardline, 2025), concluded that only Stations ENV214 and ENV222 met the suitability criteria recording >10% gravel and a Wentworth (1922) classification of coarse sand. However, none of the stations where PSA was collected recorded sufficiently low percentage fines (<5%) in combination with high enough (>10%) gravel content to be considered prime in terms of habitat sediment preference for herring spawning.

The stations along the route also coincided with low intensity spawning and nursery grounds for sand eels (Ellis *et al.*, 2012). Based on the results of the PSA, six stations recorded <10% fines and >50% sand, meeting the suitable habitat sediment preference criteria. These stations also met the preferred habitat sediment classification of sand under the modified Folk (1954).

2.4.2 Total Organic Carbon

The results of the TOC analysis are presented in Table 2.1. The TOC content is measured as a percentage of the total sample mass, representing the organic carbon constituent of the organic matter. Organic matter in marine sediments primarily comprises detrital matter and naphthenic materials (carboxylic acid and humic substances with a small proportion of biological biomass).

Across the 30 stations where TOC was analysed, concentrations were ≤0.28% in the northern and central areas and, with the exception of Stations ENV221 and ENV200, ranged from 0.52% to 5.13% in the southern area. The TOC content at Stations ENV221 and ENV200 was significantly higher at 9.23% and 12.40%, respectively (Grubbs' $p<0.01$, Appendix F). The higher TOC content recorded in the southern area is likely attributed to the proximity to the coastline and the rivers Tyne and Wear. A significant negative correlation was observed between TOC and depth (Spearman's; $r=-0.60$, $p<0.01$; Appendix F), with a positive correlation between TOC and percentage fines (Spearman's $r=0.71$, $p<0.01$; Appendix F).

In general, for continental shelf sediments there is a close relationship between the organic carbon content and the surface area of the mineral matrix (Mayer, 1994). Increased TOC content is expected with fine sediments, as it adsorbs to the increased surface area provided by the fine grain particles. As such, the positive correlation between TOC content and fines was expected.

Overall, these TOC concentrations were significantly higher (t-test $p<0.05$) than previously recorded along the ECR by Gardline (2024b). However, the spatial trend of lower TOC content at the northern and central stations, and variable TOC content at the southern stations was consistent with the previous survey (Gardline, 2024b).

2.5 Hydrocarbon Concentrations

2.5.1 Total Hydrocarbons and Alkanes

At 30 stations along the route, concentrations of THC were analysed using UVFS to meet MMO (2023) guidelines (Table 2.2). Of these 30 stations, 4 were located in Scottish waters and at these, concentrations of THC were additionally analysed by GC-FID. Details of analytical methods are presented in Appendix B.

Concentrations of THC by UVFS ranged from ≤2.7µg g^{-1} in the northern and central areas and, within the southern area, ranged from 15.5µg g^{-1} at Station ENV186 to 572µg g^{-1} at Station ENV221. Significant variation between the 20 stations along the southern area of route was observed, with THC significantly positively correlated with TOC content (Spearman's; r=0.79, p<0.01, Appendix F). Concentrations of THC were also observed to be the higher near the coast, in regions of higher densities of vessel traffic, presented in Figure 2.2 with THC values overlaid on weekly vessel traffic for 2019 (EMODnet, 2023). Overall, these concentrations were significantly higher (t-test p<0.05) than previously recorded along the ECR by Gardline (2024b). However, the spatial trend of lower THC concentrations at the northern and central stations, and variable THC concentrations at the southern stations was consistent with the previous survey (Gardline, 2024b).

A summary of the results of the hydrocarbon analyses conducted in Scottish waters is presented in Table 2.3 together with the concentrations of n-alkanes nC_{10} to nC_{37}, pristane and phytane. Individual n-alkane concentrations are tabulated in Table 2.4, with bar charts for the four Scottish stations in Appendix G. Concentrations of THC analysed by GC-FID (comprising n-alkanes, pristane, phytane, unresolved complex matrix (UCM) and PAHs) ranged from 2.2µg g^{-1} at Station ENV179 to 4.5µg g^{-1} at Station ENV173 with a mean of 3.5µg g^{-1} (±1.0SD). Concentrations of THC analysed by GC-FID were lower (t-test; p<0.05) than those recorded in the comparison survey (Gardline, 2024b).

To put these into a wider context, UKOOA (2001) reported a mean THC concentration of 9.51µg g^{-1} (measured by GC, n=159) and a 95th percentile of 40.1µg g^{-1} for CNS stations over 5km from existing infrastructure, sampled between 1975 and 1995. No stations in Scottish waters exceeded these levels and could therefore be considered consistent with background concentrations.

It has previously been shown that benthic macrofauna may suffer adverse effects when THC concentrations are in excess of 50µg g^{-1} (Kjeilen-Eilertsen *et al.*, 2004; UKOOA, 2002; 2005) and as such, this value represents the threshold above which hydrocarbons are expected to have significant environmental impact. Kingston (1992) also previously reported that benthic macrofauna suffer adverse effects, namely reduced diversity, when THC concentrations are more than 50 to 60µg g^{-1} and that specific sensitive species may be impacted at levels greater than 10µg g^{-1}. Mair *et al.* (1987) observed a notable increase in the dominance of opportunistic species at THC levels greater than 291.4µg g^{-1}. The THC by UVFS concentrations exceeded 50µg g^{-1} at thirteen stations along the southern area of the route, and at four of these stations (ENV222, ENV221, ENV200 and ENV201), the concentrations exceeded 291.4µg g^{-1}, therefore the faunal community may be adversely affected by THC at these stations. This is explored further in Section 2.9.

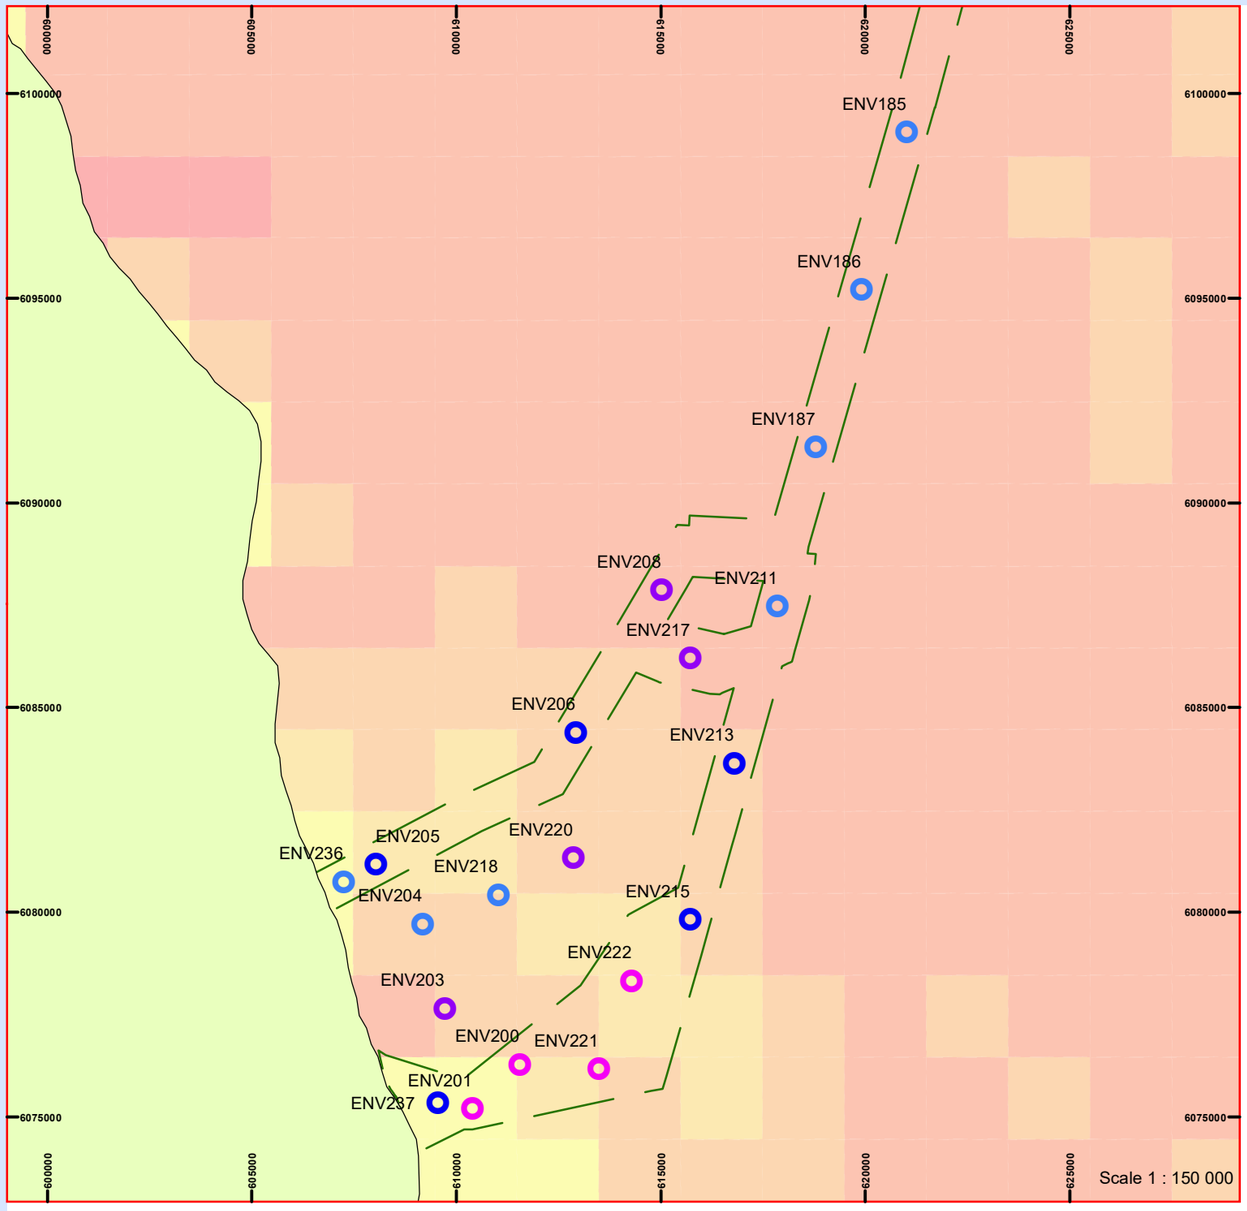
Although THC concentrations give an indication of the total oil in the sediment at each station, it does not give an indication of the source. Analysis of the GC chromatograms (Appendix G) may provide an indication of the origin of hydrocarbons in marine sediments and the extent to which they are weathered. Peaks in the gas chromatograms correspond to individual n-alkanes and other compounds, with carbon numbers increasing with elution time. The area beneath the trace constitutes the UCM (see Appendix D for further information) of hydrocarbons that could not be resolved by GC. This UCM includes cycloalkane compounds, which remain after substantial weathering and biodegradation of petrogenic inputs to the sediment (McDougall, 2000).

The chromatograms from the Scottish stations generally presented a consistent pattern of low level, HMW resolved n-alkanes and UCM ranging from approximately nC_{24} to nC_{35} with a peak between nC_{32} and nC_{34}. Such distributions are considered typical of background levels of hydrocarbon inputs in areas of historical oil and gas exploration, which include a relatively low level UCM distributed between nC_{20} to nC_{33} (McDougall, 2000). Overall, the UCM accounted for 56 to 76% of THC across the four stations, indicating that hydrocarbons were from a mixture of both weathered and fresher inputs. Typically, hydrocarbons in the molecular weight range nC_{24} to nC_{36} commonly originate from terrestrial plant sources (Harborne, 1999), or may represent the residue of highly weathered or biodegradable petrogenic material, including natural seeps, shipping discharge and oil and gas exploration and extraction (Bouloubassi *et al.*, 2001; McDougall, 2000). The chromatograms display larger resolved peaks over HMW n-alkanes with a general predominance of heavier weight n-alkanes and compounds with odd carbon numbers over those with even carbon numbers. This profile is characteristic of background hydrocarbons in North Sea sediments and indicative of low-level sedimentary biogenic hydrocarbons from a terrestrial plant source (Harborne, 1999; Tran *et al.*, 1995; Wang & Fingas, 2005).

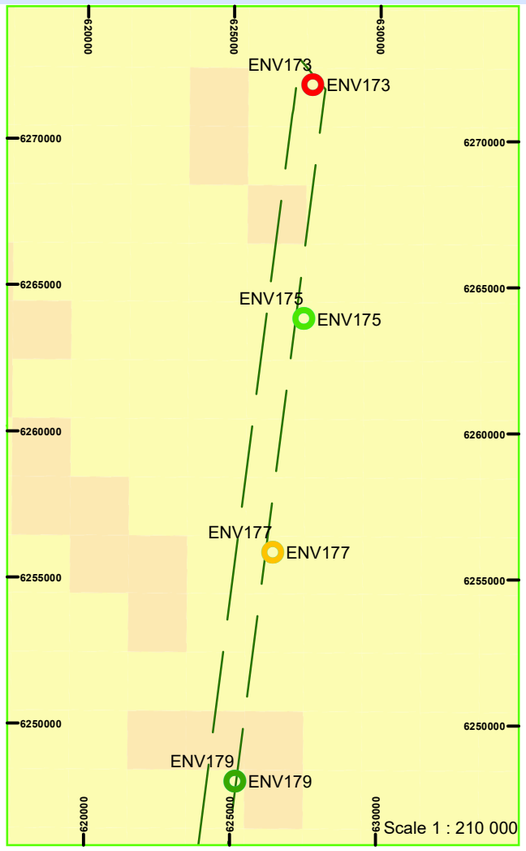
Further insight into the origin of hydrocarbons in marine sediments can be gained by measuring concentrations of individual n-alkanes (Table 2.4). Total n-alkane concentrations varied between 0.049µg g^{-1} at Station ENV179 and 0.080µg g^{-1} at Station ENV177. The concentrations of n-alkanes were distributed with a greater proportion of HMW n-alkanes (nC_{21} to nC_{37}) which accounted for 71 to 98% of the total n-alkanes across the four stations sampled in Scottish waters. Peaks in n-alkane concentrations at all stations were at odd numbers within the range nC_{25} and nC_{31}, with the highest peaks around nC_{29} and nC_{31}. Their distribution within the HMW range indicated the presence of biogenic n-alkanes most likely derived from diffuse higher terrestrial plant waxes (Bouloubassi *et al.*, 2001). Furthermore, the secondary peak in n-alkane concentrations centred on nC_{15} at Station ENV177 is consistent with biogenic sources such as phytoplankton (Zhang *et al.*, 2024).

In general, the distribution of n-alkanes and concentrations were consistent to those of the comparison survey (Gardline, 2024b). To put these into a wider context, UKOOA (2001) reported a mean n-alkane concentration of 0.400µg g^{-1} (measured by GC, n=307) and a 95th percentile of 1.180µg g^{-1} for CNS stations over 5km from existing infrastructure, sampled between 1975 and 1995. No stations in Scottish waters exceeded these levels and could therefore be considered consistent with background concentrations.

The ratio of odd to even numbered n-alkanes within the HMW range (nC_{26} to nC_{30}), commonly referred to as the carbon preference index (CPI), can provide further insight into the origin of alkanes in marine sediment. Marine sediments containing a high level of biogenically derived (odd carbon number) n-alkanes are known to have CPI ≥2.0, with values ≥4.0 suggesting a virtual absence of petrogenic hydrocarbons (McDougall, 2000). CPI values close to 0 indicate a predominance of petrogenic hydrocarbons. Across the four stations where analysis was conducted, CPI values ranged from 3.0 to 4.4 with a mean 3.7 (±0.6SD) suggesting a dominance of biogenic inputs. Station ENV173 recorded a CPI value of 4.4 indicating a virtual absence of petrogenic hydrocarbons.



To put this into context, CPI across the stations analysed was within the range recorded in the comparison survey (Gardline, 2024b).



The ratio of isoprenoids pristane and phytane can be used to derive similar information to the CPI where a high pristane:phytane ratio is indicative of biogenic hydrocarbons most commonly originating from the decomposition of the phytol side chain of chlorophyll (Muniz *et al.*, 2004). The isoprenoid pristane is primarily biogenic in origin (Bouloubassi *et al.*, 2001; Muniz *et al.*, 2004) while phytane is rarely produced biogenically but is a common component of crude oil (Steinhauer & Boehm, 1992). Pristane concentrations ranged from 0.007µg g^{-1} at Station ENV175 to 0.014µg g^{-1} at Station ENV177, whereas phytane was <0.001µg g^{-1} at all four stations consistent with a predominance of biogenic hydrocarbons.

2.5.2 Polycyclic Aromatic Hydrocarbons

A summary of the total 2-6 ring PAH and total naphthalene, phenanthrene and dibenzothiophene (NPD;2-3 ring) concentrations for the four Scottish stations are presented in Table 2.3, while the results of MMO (2023) accredited PAH analysis at all sampled stations are presented in Table 2.5. For the four Scottish stations, a breakdown of the individual PAHs and their alkyl derivatives is presented in Table 2.6 and as bar charts showing the proportion of parent compounds and alkylated homologues for each PAH molecular weight class in Appendix G. In addition, the United States Environmental Protection Agency (US EPA) sixteen priority PAH concentrations for all sampled stations are presented in Appendix G. Detailed information on analytical methods is presented in Appendix B.

Total PAH concentrations of analytes quantified under MMO (2023) accredited analysis (Table 2.6) were ≤0.006µg g^{-1} in the northern area and ≤0.120µg g^{-1} in the central area. However, within the southern area,

concentrations ranged from 1.042µg g^{-1} at Station ENV211 to 14.468µg g^{-1} at Station ENV201 and were significantly higher at Stations ENV221 and ENV200, recording concentrations of 25.420µg g^{-1} and 28.080µg g^{-1}, respectively (Grubbs' r=3.12, p<0.01; Appendix F). Across the 30 stations, total PAH concentrations showed a significant positive correlation with sediment fines and TOC (Spearman's r=0.67; r=0.98, p<0.01; Appendix F). Overall, these concentrations were significantly higher (t-test p<0.05) than previously recorded along the ECR by Gardline (2024b). However, the spatial trend of lower PAH concentrations at the northern and central stations, and variable THC concentrations at the southern stations was consistent with the previous survey (Gardline, 2024b).

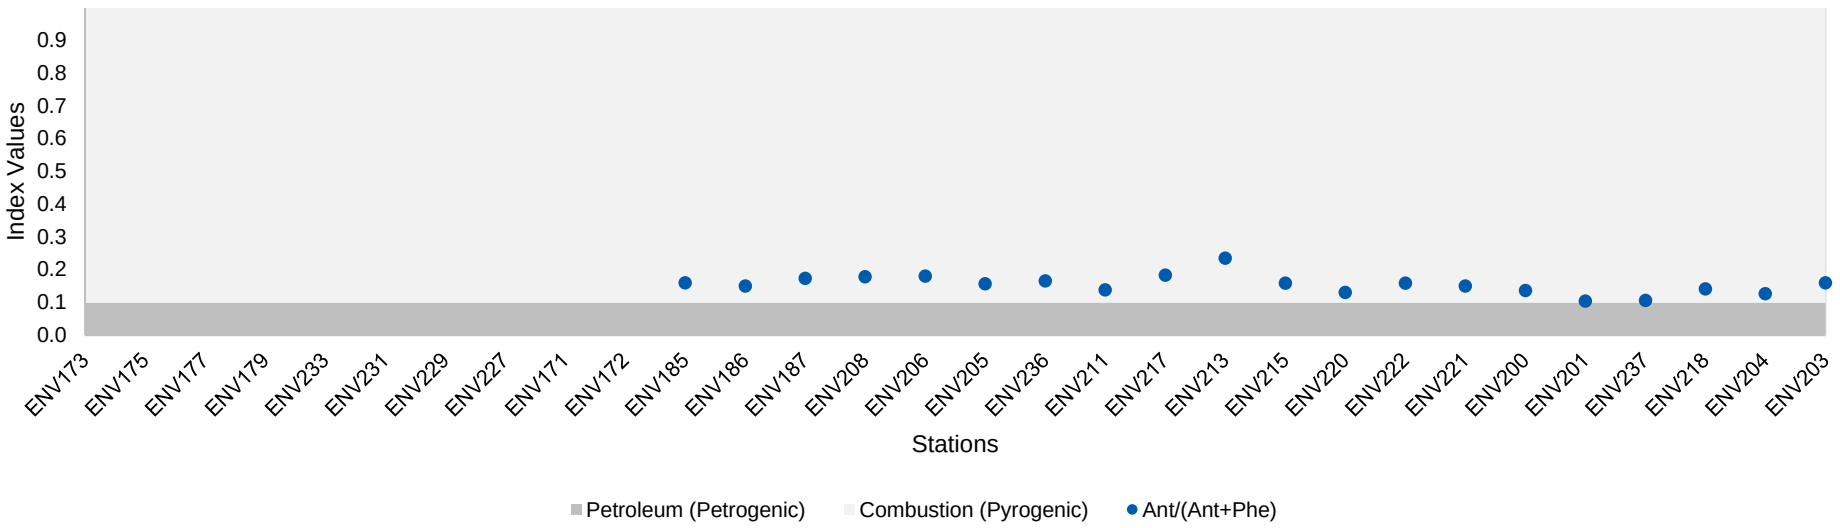
Information on the origins of PAHs can be derived from the parent compound molecular weight indices as detailed by Yunker *et al.* (2002) and adopted in Fisner *et al.* (2013), these are presented in Figure 2.3. The molecular mass indices identified predominantly pyrogenic PAHs with potentially mixed sources at Stations ENV201 and ENV237 for the 178 molecular weight index.

Further evidence of petrogenic inputs can be observed from the prevalence of alkylated homologues over parent compounds (Wang & Fingas, 2005). As illustrated in Figure 2.4, it is evident that the alkylated homologues of the LMW naphthalene and phenanthrene are more abundant than their parent compounds which indicates there are PAHs from petrogenic sources present. This pattern is consistent with the comparison survey.

The best estimates of the potential toxicity of PAHs in marine sediments are the ERL and ERM values (Long *et al.*, 1995), as described in Section 1.4 and Appendix D. Total PAH concentrations at stations along the northern and central areas of the route were well below their respective ERL values (4.022µg g^{-1}) and therefore indicate that toxic effects to fauna by PAHs are unlikely in these areas of the route. Table 2.5 highlights that of the 20 stations in the southern area, 11 recorded total PAH concentrations above the ERL and, other than Stations ENV186 and ENV211, all 20 stations recorded concentrations above ERL for one or more PAH analytes. Further, the concentration of phenanthrene at Stations ENV200 and ENV221 exceeded their respective ERM value (1.500µg g^{-1}).

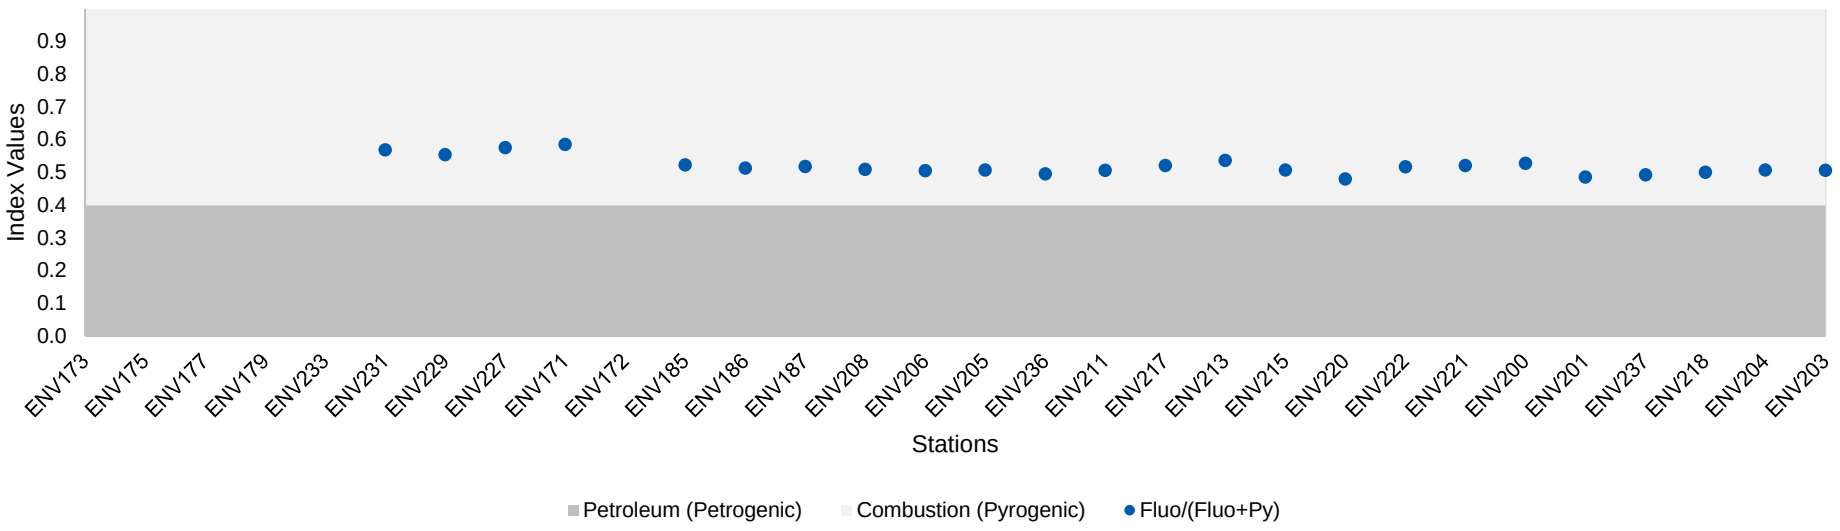
The AET (Buchman, 2008) represents the concentration above which adverse biological impacts would be expected on the biological indicator due to exposure to that contaminant alone. Individual PAH concentrations, including naphthalene, were above their respective AETs at several stations in the southern area of the route, further indicating that adverse biological impacts are possible in this area.

OSPAR (2005) published BC, BAC and BRC tools to assess concentrations of certain hazardous substances (see 1.4). Comparison to OSPAR BC, BAC and BRC (OSPAR, 2005; 2009a) data required normalisation of the PAH concentrations to 2.5% TOC, as presented in Appendix G. Where concentrations were above LOD, most compounds at the southern area stations and at Stations ENV229, ENV227 and ENV171 in the central area exceeded their exceeded their respective BCs. The BRC max for the northern North Sea (as defined by OSPAR (2005)) was exceeded at all stations where concentration were above LOD for acenaphthylene, acenaphthene and fluorene, with dibenzo[a,h]anthracene above BRC max at nine stations. Further, the survey averages for above LOD concentrations of nine US EPA PAHs exceeded their respective BACs. Additionally, concentrations of naphthalene, anthracene, fluoranthene and pyrene exceed EAC thresholds at several stations in the southern area. As mentioned in Section 1.4 normalisation to 2.5% TOC within coarser or predominantly sandy substrate areas with low TOC means these thresholds are subject to greater extrapolation and uncertainty.



Total PAHs for the four Scottish stations reached 0.012µg g^{-1} at Stations ENV175 and ENV177 (Table 2.3). These values were similar to those previously recorded in the comparison survey (Gardline, 2024b). Further, concentrations were below the UKOOA (2001) mean of 0.287µg g^{-1}.

The 2-3 ring NPD concentrations for the four Scottish stations reached 0.005µg g^{-1} at Station ENV177 (Table 2.3), consistent with a lack of petrogenic contamination in the northern area of the route. The NPD concentrations for these stations is consistent with the comparison survey (Gardline, 2024b) along with all concentrations being below the UKOOA (2001) mean of 0.105µg g^{-1} for CNS stations.



When compared against OSPAR (2005) BC, BAC and BRC in Appendix G, none of the EPA 16 PAH compounds analysed at the Scottish stations exceeded their respective BC values, or AET thresholds (Buchman, 2008).

Figure 2.3 PAH Molecular Weight Indices

2.5.3 Polychlorinated Biphenyl Concentrations

At 30 stations along the route, concentrations of PCBs were analysed by ultrasonic solvent extraction followed by GC-MS-MS. Further details of analytical methods are presented in Appendix B. Concentrations of all 25 PCB congeners were below LOD at stations along the northern and central areas of the route and at three of the stations in the southern area of the route. Concentrations of each of the ICES 7 PCBs, together with totals for both the ICES 7 and 25 PCB Congeners are presented for all stations in the southern area of the route in Table 2.7. Full results for each of the 25 PCB congeners across all 30 stations are presented in Appendix G.

Of the seventeen stations with concentrations above LOD, none exceeded the CAL 1 concentration or Long *et al*. (1995) ERL concentration (Table 2.7).

The ICES-7 PCBs, which are congeners that cover the range of toxicological properties of the group, were compared against OSPAR (2009a) thresholds after normalisation to 2.5% TOC (Appendix G). The only EAC threshold exceeded was for PCB118 at Station ENV203. As mentioned in Section 1.4 normalisation to TOC within coarser or predominantly sandy substrate areas means these thresholds are subject to greater extrapolation and uncertainty. Concentrations PCBs for stations with values above LOD, were similar (t-test; $p>0.05$) to those recorded for the comparison survey (Gardline, 2024b), other than for PCB 118 and total ICES-7 PCBs, for which concentration were higher than the previous survey (t-test; $p<0.05$).

According to OSPAR (2013), PCB153 is generally present in the highest concentrations and correlates well with other analysed PCBs, while PCB118 is representative of the more toxicologically relevant mono-ortho/planar PCBs. In the current survey PCB118 was recorded at similar concentrations to that of PCB153 (t-test; $p<0.05$) indicating that toxicological effects of PCBs may be apparent.

2.6 Metal Concentrations

2.6.1 Trace Metal Concentrations

Following extraction by aqua regia, concentrations of As, Cd, Cr, Cu, Hg, Ni, Pb and Zn were determined by ICP-MS at 30 stations, with results presented in Table 2.8. In addition, at four stations located in Scottish waters following HF acid extraction, concentrations of As, Cd, Cr, Cu, Pb, Hg, Ni, V and Zn were determined by ICP-MS whilst Ba was determined by ICP-OES, with results presented in Table 2.9. A direct comparison between the current data and the respective Long *et al*. (1995) ERL, ERM and Buchman (2008) AET levels are also presented in Table 2.9. Further details of analytical methods are presented in Appendix B. As aluminium (Al) was not tested for, the normalisation to 5% Al concentrations for comparison with the OSPAR (2005) BC, BAC and BRC values could not be carried out. Therefore, normalisation to 1% TOC was conducted to allow comparison to the OSPAR (2009c) EACs and presented in Appendix H.

The highest concentrations of the metals following aqua regia digest were recorded at the southern area Stations ENV200, ENV203 and ENV215, corresponding with higher proportions of fine sediment and or highest concentrations of TOC, indicating these concentrations were consistent with natural variation. When all 30 stations were considered, metals strongly correlated with the increasing proportion of fines, TOC and total PAH concentrations (Spearman's $p<0.01$, Appendix F). All metals, except Cr, were also negatively correlated with depth ($p<0.01$; Appendix F). When looking specifically at the 20 stations in the southern area, these correlations with natural physico-chemical variables remained other than for Cd, which only correlated with total ICES-7 PCB concentrations (Spearman's $p<0.01$, Appendix F).

Metal concentrations following aqua regia digest were directly compared to CALs (MMO, 2023). Of the metals that were analysed, four (As, Ni, Pb and Zn) reported concentration above CAL 1 at one or more stations, with Stations ENV200 and ENV203 recording concentrations above CAL1 for all four of these metals. No analyte was reported to exceed CAL 2. Three or more metals were at concentrations above the UKOOA (2001) 95th percentile for bioavailable metals at all stations within the southern area of the route, with Cu ,Pb and Zn exceeding the threshold at all twenty stations, indicating that the concentrations of these metals may be considered above the bioavailable background for the CNS. Overall, metals concentrations were significantly higher (t-test $p<0.05$) than previously recorded along the ECR by Gardline (2024b). However, the spatial trend of lower metal concentrations at the northern and central stations, and variable metal concentrations at the southern stations was consistent with the previous survey (Gardline, 2024b).

Barium can be an important element in the detection of localised anthropogenic sediment pollution. It is often used in the form of barite (barium sulphate, $BaSO_4$) as a weighting agent in drilling fluids. Barium concentrations following HF digest at the four Scottish stations ranged from 253µg g^{-1} to 269µg g^{-1}. To put this into the wider context, all four stations were below the UKOOA (2001) mean for the CNS and can therefore be considered consistent with background concentrations. Further, Neff (2004) suggested that sediments not contaminated by drilling cuttings may contain Ba concentrations up to 2000µg g^{-1}, a concentration that was not exceeded at any sampled station within the current survey.

Concentrations of all metals analysed by HF digest at the four stations in Scottish waters were below their respective Long *et al*. (1995) ERL, ERM and Buchman (2008) AET values, with the exception of As at Station ENV179 which exceeded its respective ERL. Concentrations were also below their respective UKOOA (2001) 95th percentile where available, indicating most metal concentrations can be considered typical of background sediments in the wider area. Concentrations of Ba, Ni and Zn were higher (t-test, $p<0.05$) than at Scottish stations in the comparison survey (Gardline, 2024b) with the remaining metal concentrations comparable or lower than previously recorded.

When normalised to 1% TOC, both aqua regia and HF digest concentrations of Pb exceeded the OSPAR (2009c) EACs at all stations, with Cd by aqua regia exceeding its respective EAC at twelve stations in the southern area, indicating that toxicological effects of these metals may be apparent. As outlined in Section 1.4 normalisation to TOC within coarser and predominantly sandy substrate areas introduces greater uncertainty to these comparisons.

2.6.2 Organotins

Concentrations of the organotins, dibutyltin (DBT), tributyltin (TBT), monobutyltin (MBT), tetrabutyltin (TTBT) and triphenyltin (TPT), where recorded above LOD, are presented in Table 2.10.

All concentrations were below the CAL 1 value of 0.1µg g^{-1}. There are currently no background concentrations or assessment criteria for organotin concentrations in sediment and the full ecological effects of organotins have not been established (OSPAR, 2017b). Polychaetes have been shown to have their growth impaired by 25% at TBT concentrations of 0.093µg g^{-1} (Meador & Rice, 2002), a concentration well above those recorded in the current survey.

Concentrations of the organotins DBT and TBT in the current survey were higher than those recorded at the only station in the comparison survey (Gardline, 2024b) with values above the LOD.

2.7 Organochloropesticides

Across the thirty stations analysed for OCPs, concentrations were below LOD at all but the twenty stations in the southern area, detailed in Table 2.11.

Dieldrin was recorded at concentrations above LOD (0.1ng g^{-1}) at five stations (ENV203, ENV206, ENV215, ENV218 and ENV222); thereby exceeding the Long *et al*. (1995) ERL of 0.02ng g^{-1}. The OCP TDE exceeded the ERL value of 2.0ng g^{-1} at Stations ENV200, ENV203, ENV215 and ENV221 with DDT exceeding both the Long *et al*. (1995) ERL and the MMO (2023) CAL 1 value at Stations ENV205 and ENV221, indicating that sensitive species may be impacted at these stations. All remaining OCP concentrations were below their

respective MMO (2023) CAL 1 and Long *et al*. (1995) ERL values. Further, all OCP concentrations were below the Long *et al*. (1995) ERM and Buchman (2008) AET concentrations.

Table 2.11 Concentrations of Organochloropesticides

2.8 Statistical Analysis of Sediment Physico-Chemical Results

2.8.1 Preparation of Data Sets

Multivariate analyses were performed using PRIMER v7 on the physico-chemical data conducted to MMO (2023) specification to ascertain similarities and differences within the environmental data set. Prior to undertaking analyses, certain variables were excluded from the sediment multivariate analyses and some of those that remained were transformed. A summary of the excluded and transformed variables for each data set is given in Table 2.12, together with the rationale for exclusion. Values were typically excluded from consideration if they were below LOD for a significant proportion of the stations. If a variable was retained but it had some stations recording concentrations below LOD, these stations were assigned a value just below the LOD to allow appropriate ranking. Variables were also excluded if they were found through PRIMER's Draftsman plot to correlate >99% with another variable. Intrinsically linked groups of variables (*e.g.,* all PSA variables) were log transformed to down-weight the influence of any high or low outliers identified through the Grubbs' test (Appendix F).

Table 2.12 Summary of Multivariate Analysis Inputs and Outputs

Data set	Excluded Variables	Rationale for Exclusion	Transformed Variables
49 Stations with PSA	None	NA	All
30 stations with PSA, TOC, Hydrocarbons, PCBs, OCPs, Organotins and Metals	Cd, Hg, OCPs, PCBs, THC by UVFS	Values below the LOD	PSA, TOC, PAH
	NPD	Correlation with Total PAHs	
20 southern area stations with PSA, TOC, Hydrocarbons, PCBs, OCPs, Organotins and Metals	Organotins	Values below the LOD	PSA, TOC, PCBs
	NPD	Correlation with Total PAHs	
	ICES-7 PCBs	Correlation with Total PCBs	

The data sets were then normalised to make variables unitless and a Euclidean distance resemblance matrix was produced. A CLUSTER analysis was performed to graphically represent the (dis)similarities between the stations, with a SIMPROF routine run in conjunction, to show whether the differences between stations were statistically significant. Stations joined by red lines are statistically indistinguishable from each other while those joined by black lines are statistically distinct. Only three or more stations can be considered a true cluster due to the permutative nature of SIMPROF. A non-metric multidimensional scaling (nMDS) routine was also run, which creates a two-dimensional plot of the stations from the similarity matrix. The configuration of the stations on the MDS plot reflects similarity with distances between stations being representative of their Euclidean distance or relative (dis)similarity.

2.8.2 Multivariate Analysis of 49 Stations with PSA Data

The Euclidean similarity dendrogram for the 49 station sediment characteristics data set is presented in Figure 2.5. The SIMPROF routine identified thirteen statistically distinct groups comprising five clusters (SIMPROF *c, d, g, h* and *m*), four closely associated pairs (SIMPROF *a, e, j* and *k*) and four outliers (Stations ENV186, ENV200, ENV215 and ENV221). SIMPROF group *a* (Stations ENV214 and ENV222) was the most distinct due to its significantly higher (>30%) gravel content. SIMPROF group *b* (Station ENV215) recorded a significantly higher (88%) fines content. SIMPROF groups *i* to *m* then separated from the remaining stations at a Euclidean distance of 2.9 and comprised southern area stations with <50% sand. A further split at a Euclidean distance of 2.2 saw the separation of SIMPROF groups *c* and *d* from the remaining stations. These comprised central and southern area stations with >80% sand. The observed patterns in the CLUSTER dendrogram were equally presented within the MDS ordination plot (Figure 2.6) and with a low stress value (0.01) this can be considered a near perfect representation of the rank (dis)similarities. The proportions of fines, sand and gravel are presented in Figure 2.7 to illustrate the trends.

Figure 2.5 Dendrogram Showing Analysis of 49 Stations with PSA Data

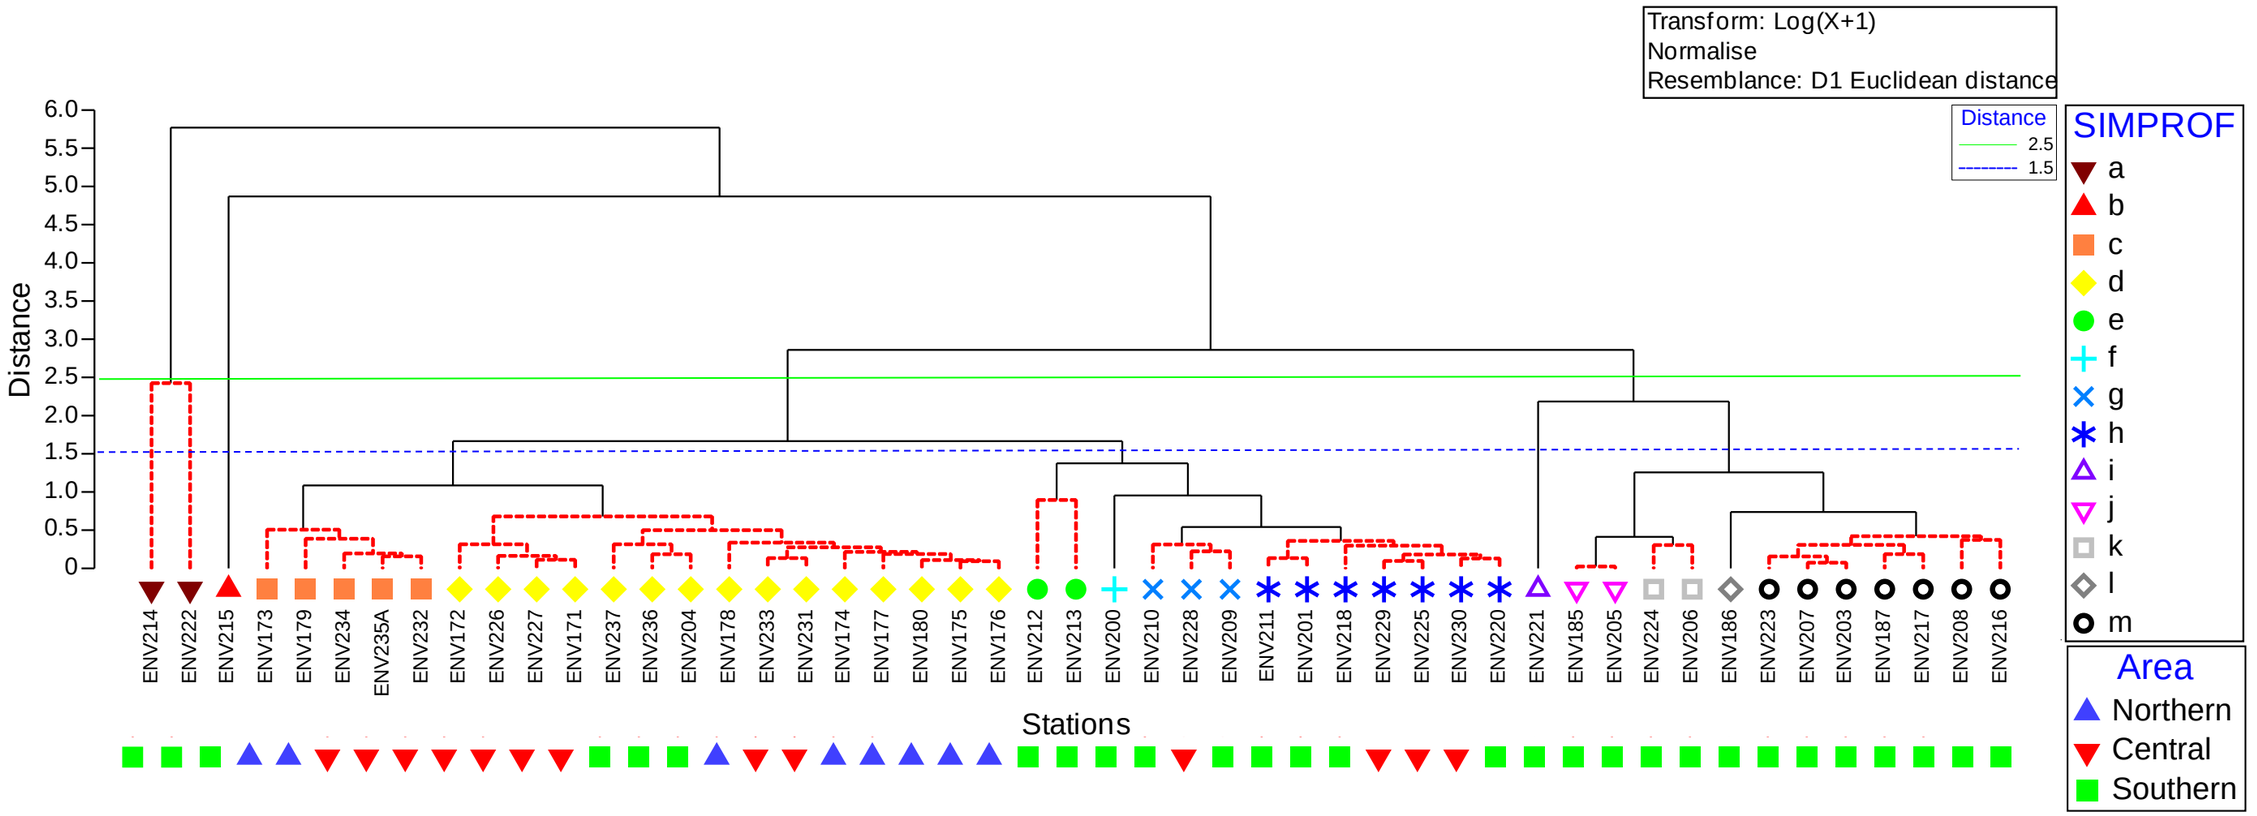

Figure 2.6 MDS Ordination Showing Groupings at Euclidean Distance of 2.5 and 1.5 at 49 Stations

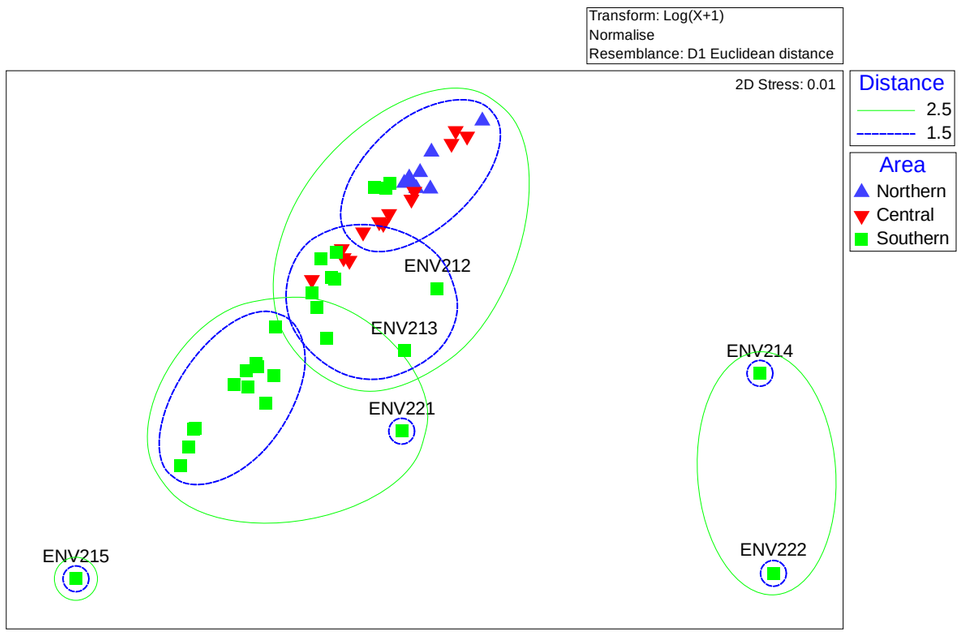

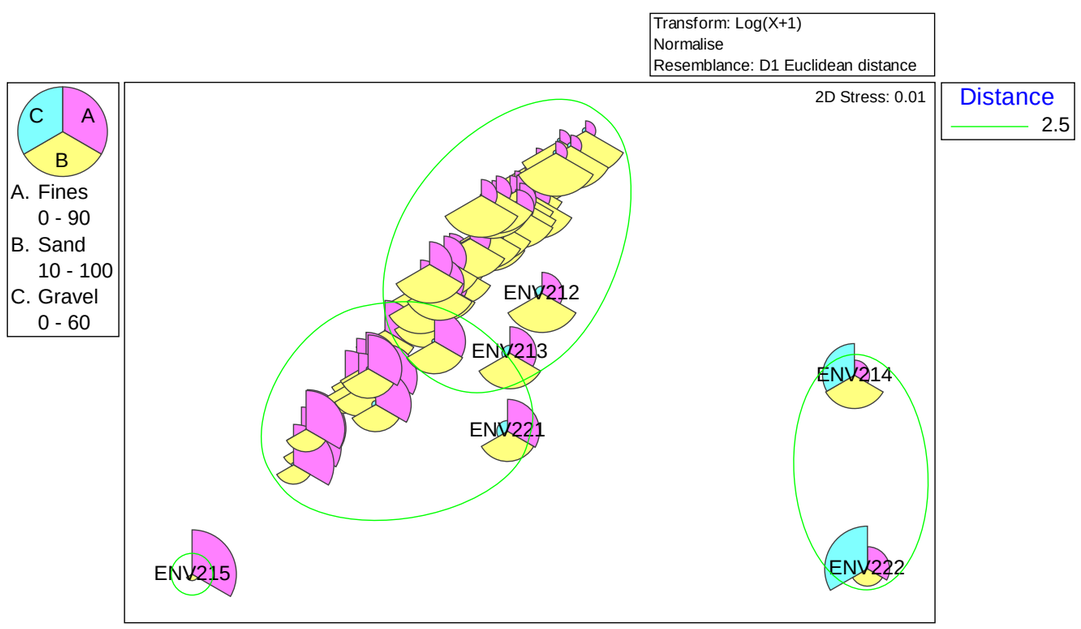

Figure 2.7 MDS Ordination with Bubbles Representing the Percentage of Fines, Sand and Gravel at 49 Stations

2.8.3 Multivariate Analysis of 30 Stations with MMO Specification Physico-Chemical Data

The Euclidean similarity dendrogram for the 30 station physico-chemical data set is presented in Figure 2.8. The SIMPROF routine identified fourteen statistically distinct groups, consisting of seven outliers (Stations ENV179, ENV185, ENV200, ENV211, ENV213, ENV215, ENV221 and ENV222), two closely associated pairs (SIMPROF *h* and *n*) and five clusters (SIMPROF *c, d, e, k* and *l*). Station ENV222 (SIMPROF group *a*) was again the most distinct due to its significantly higher (>55%) gravel content.

SIMPROF groups *i* to *n* then separated from the remaining stations at a Euclidean distance of 5.5 and comprised southern area stations with the highest TOC and metal concentrations. A further split at a Euclidean distance of 3.2 saw the separation of all central and northern stations (SIMPROF groups *b* and *d*) from the remaining southern area stations. The observed patterns in the CLUSTER dendrogram were consistent with the MDS ordination plot (Figure 2.9) and with a stress value of 0.04, this can be considered a near perfect representation of the rank (dis)similarities and overall pattern observed.

The results of the BIO-ENV analysis indicated that five analytes, comprising mean diameter, PAH, As, Cr and Pb showed a 99% correlation with the overall multivariate pattern, and these have been presented as bubbles in Figure 2.10 to illustrate their trends.

2.8.4 Multivariate Analysis of 20 Southern Area Stations with MMO Specification Physico-Chemical Data

The Euclidean similarity dendrogram for the southern area 20 station physico-chemical data set including THC, PCBs and OCPs is presented in Figure 2.11. The SIMPROF routine identified thirteen statistically distinct groups comprising two clusters (SIMPROF *f, g* and *m*), two closely associated pairs (SIMPROF *e* and *l*) and six outliers (Stations ENV185, ENV200, ENV205, ENV211, ENV213, ENV221 and ENV222). Station ENV222 (SIMPROF group *a*) was again the most distinct due to its significantly higher (>55%) gravel content.

SIMPROF groups *i* to *m* then separated from the remaining stations at a Euclidean distance of 6.4 and comprised outlier Stations ENV221 and ENV200 with their higher PAH concentrations along with six other stations (ENV203, ENV205, ENV206, ENV207, ENV208, ENV215 and ENV217) that recorded the highest total OCP concentrations and generally higher metal concentrations. A further split at a nominal Euclidean distance of 4.3 saw the separation of five stations (ENV185, ENV186, ENV187, ENV211 and ENV213; SIMPROF groups *b* and *e*) from the remainder due to their lower metal concentrations, but finer sediments. The observed patterns in the CLUSTER dendrogram were consistent with the MDS ordination plot (Figure 2.12) and with a stress value of 0.08, this can be considered a good representation of the rank (dis)similarities and overall pattern observed.

The results of the BIO-ENV analysis indicated that five analytes, comprising mean diameter, THC, Cu, Ni and Pb showed a 97% correlation with the overall multivariate pattern, and these have been presented as bubbles in Figure 2.13 to illustrate their trends.

2.9 DNA Metabarcoding Results

2.9.1 Overview

As summarised in Table 1.1, sediment eDNA samples (primary and spare) for infauna and bacterial analysis were acquired where macrofauna sampling was conducted at 49 stations. In addition, at 30 stations where physico-chemistry samples were acquired, sub-samples (primary and spare) were taken for sediment fish eDNA analysis. The primary sediment samples from 30 of these stations were sent to the laboratory for analysis. Further, at these 30 and an additional 4 stations, water sampling for fish (excluding rays and sharks) and marine mammals was undertaken. Samples were acquired at the near surface and near seabed and sent to the laboratory. All remaining samples were retained as spares. All records are provided in Appendix I. Each row represents one operational taxonomic unit (OTU), shown with the lowest possible taxonomic assignment based on current available reference data. Each column represents a sample, showing the proportion of sequence reads per detected OTU. Care should be taken in interpreting the numbers of reads in terms of relative species abundance or biomass as unavoidable biases introduced during the laboratory process can have a major effect on this relationship, for example, some species amplify more readily than others during processing. Additionally, multiple OTUs relating to the same species may be detected which may create analytical bias. Whilst each analysis (bacterial, infaunal, fish or mammal) targets a specific taxonomic group, a single taxon may be detected in multiple analyses.

The most conservative approach is to analyse the data in terms of presence-absence. Due to the number of taxa included in the analysis, presence-absence data still have a high statistical power for demonstrating change. If abundance data for a particular species are important to the project, then incidence across multiple samples can be used as a proxy for abundance (*e.g.* a species detected in every sample replicate is likely to be more abundant than one found in a small proportion of replicates).

Due to the methodology employed, other species beyond the targeted group were identified. These species were removed from analysis but are included in the full data set presented in Appendix I.

2.9.2 Summary of Notable Species

The presence of eDNA does not exhaustively determine the presence of a taxon as the eDNA can persist in the environment after the organism has left the area or perished.

Several species of fish were identified within samples, including ten classified as protected under legislation, see Table 2.13 for details. Of these, Atlantic cod (*Gadus morhua*) and Atlantic horse mackerel (*Trachurus trachurus*) were also detected from eDNA in the comparison survey (Gardline, 2024b). The bivalve *A. islandica,* which was detected in both the current and comparison survey (Gardline, 2024b), is a species listed as a threatened and/or declining under OSPAR (2008). Additionally, the tube building worm *Sabellaria spinulosa* was detected. This species is known to form biogenic reefs which are a habitat listed under Annex I of the EU Habitats Directive (1992) and on the OSPAR (2008) list of threatened and/or declining species and habitats. It is also recognised as a PMF in Scottish waters (NatureScot, 2020).

Further, five marine mammals species were recorded, all of which are protected species under legislation, see Table 2.14 for further details. Of these, the dolphin *Lagenorhynchus albirostris* and porpoise *Phocoena phocoena* were also detected in the comparison survey (Gardline, 2024b).

2.9.3 Sediment eDNA Summary Statistics

A total of 1484 OTUs were detected along the route as reported in Table 2.15. Of the 1484 detected OTUs, a lower percentage (1%) of bacterial OTUs were identified to species level when compared to other targets, possibly related to a smaller pool of reference material for bacterial OTUs. The number of OTUs was slightly higher than recorded in the comparison survey (n=1025; Gardline, 2024b).

Table 2.15 OTU Detections per Target and Percentrage Successfully Classified

Sample Type	Target	Samples Analysed	Number of OTUs	% Contribution					
				Phylum	Class	Order	Family	Genus	Species

1 Sample acquired using a bacterial filter

Bacteria

The sediment bacterial data set detected 1179 OTUs across 39 taxonomic groups based on class, with the proportional contributions of these taxonomic groups to the overall structure of the survey area detailed in Table 2.16 and presented for each of the 30 stations in Figure 2.14. The Others category comprised 433 OTUs which could not be identified to class.

The most detected taxonomic group along the route was Others (n=433) which accounted for 36% of the OTUs. The second most detected group was Gammaproteobacteria (n=85) accounting for 14% of OTUs. The dominance of Gammaproteobacteria is somewhat expected given it is one of the richest classes of bacteria (Williams *et al.*, 2010). The relative dominance of Others within the proportional was partly due to the inability to resolve to further than Phylum (n=177) or Kingdom (n=187).

A total of 85 bacterial OTUs (7%) were detected in all sediment samples, while 196 OTUs (16%) were identified at only one station along the route. These numbers of widespread taxa and lone taxa along the route suggest that the community had been subjected to relatively little disturbance.

Similar trends were recorded for the comparison survey (Gardline, 2024b), where 30 taxonomic groups were detected. The most abundant taxonomic groups were previously also Others (35% of OTUs (n=218)) and Gammaproteobacteria (21% of OTUs (n=128)). Despite there being fewer samples collected in the current survey (n=30) than in the comparison survey (n=65), overall there were more classes detected with only three of the previously detected classes being absent in the current survey and all have been included in Table 2.16 for comparison.

Figure 2.14 Contributions of Gross Bacterial Sediment OTU Taxonomic Groups

Infauna

A total of 159 OTUs across 26 taxonomic groups based on class were detected from the sediment infaunal data sets, with the proportional contribution of the taxonomic groups to the overall structure of the survey area detailed in Table 2.17 and presented for each of the 30 stations in Figure 2.15. The Others category comprised 13 OTUs that could not be identified to class.

Polychaeta (n=54) was the most detected taxonomic group along the route, accounting for 34% of OTUs. The next most detected group was Copepoda (n=28; 18%) and this was to be expected as copepods are some of the most common zooplankton in the North Sea (Broekhuizen & McKenzie, 1995). Thirteen infaunal taxonomic groups were represented by a single OTU (Table 2.17).

The most widespread OTU was the gastropod *Turbonila* IM-I55NUH, which was detected at 26 of the 30 stations. Of the 159 infaunal OTUs, a total of 58 (36%) were present in a single sample along the route. However, unlike the bacterial data set, none was detected in all samples. The absence of a consistent infaunal community is somewhat expected given the geographical spread of the stations, however, the relatively high proportion of lone OTUs suggests community heterogeneity along the route that may have been under sampled for the infaunal size class.

When compared to the comparison survey (Gardline, 2024b), both Polychaeta and Copepoda were also the most detected groups previously; however, overall, there were fewer OTUs detected in the current survey, with 303 having previously been sampled across 65 stations.

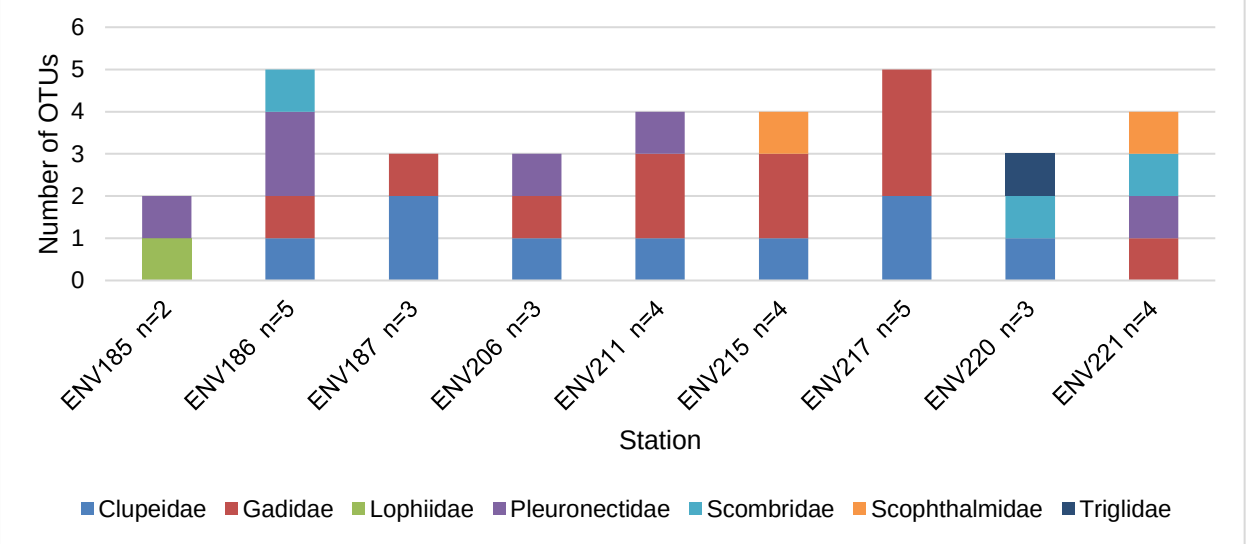
Figure 2.15 Contributions of Gross Sediment Infaunal OTU Taxonomic Groups

Fish



Of the 30 fish eDNA samples analysed, target species were identified in 9 samples, no eDNA was amplifiable in 6 samples, no target species were identified in 10 samples and data QC failed at 5 samples. All results described below are derived from the bacterial filter extraction; however, these data should be treated with caution as the preservative and filter pore size were not optimised for the extraction of vertebrate eDNA and therefore cannot be compared with the comparison data.

A total of seventeen OTUs across seven taxonomic groups based on family were detected, with the proportional contribution of these taxonomic groups to the overall structure of the survey area detailed in Table 2.18 and presented for each of the 30 stations in Figure 2.16. Pleuronectidae (n=5) was the most detected group along the route, accounting for 29% of OTUs. The second most detected group was Gadidae (n=4; 24%) with three taxonomic groups represented by a single OTU.

Total Families	**7**	**100**

Figure 2.16 Contributions of Gross Sediment Fish OTU Taxonomic Groups (Bacterial Filter)

Comparative taxonomic heat trees detailing the number of OTUs along the route from sediment samples for bacterial, infaunal and fish data sets down to the order rank are presented in Figure 2.17, Figure 2.18 and Figure 2.19, respectively. The nodes (circles) represent a taxon, whilst the lines detail the hierarchical relationships between taxa. The colour scale and relative width of the nodes represent the number of OTUs for each taxon. Labels without nodes represent missing taxa. Summary statistics for the sediment eDNA richness are detailed in Table 2.19.

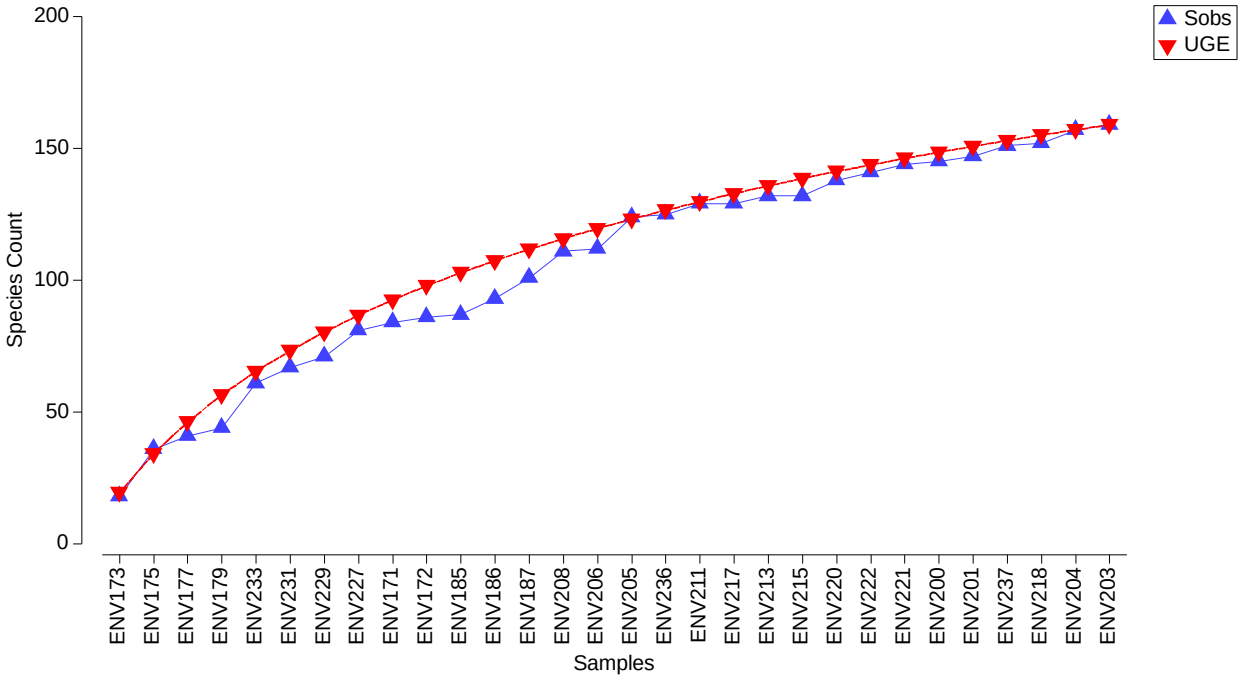
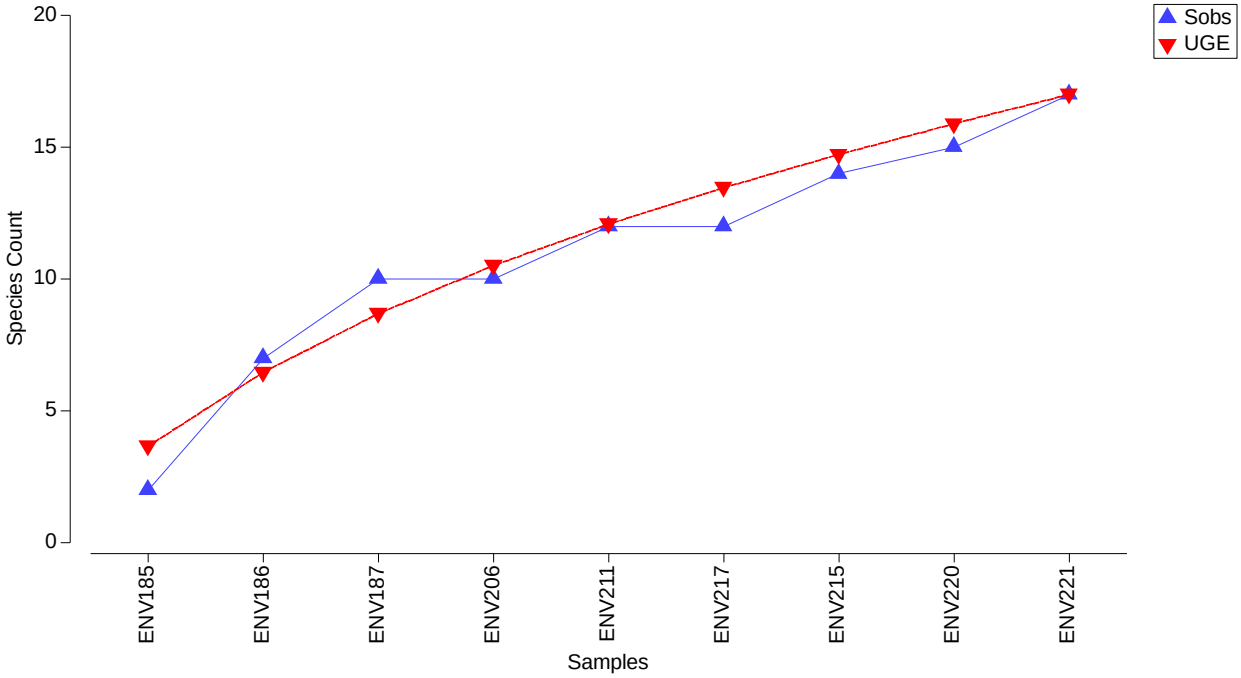
* Fish data not comparable with the comparison survey (Gardline, 2024b)
Results in blue are from the comparison survey data, see Section 1.3.

Accumulation plots of OTUs for the sediment bacterial, invertebrate and fish data sets along the route are presented in Figure 2.20, Figure 2.21 and Figure 2.22, respectively. These plots show the increasing total number of different OTUs observed as samples are pooled. Two lines are plotted; the first (plotted in blue and often referred to as a Sobs curve) adds the new taxa to those already recorded, in sample order. The second line (plotted in red and often referred to as the UGE curve) is smooth, as it is an average output based on the samples being added in a random order 999 times (Ugland *et al.*, 2003). Sharp changes in the slope of the Sobs curve reflect notable changes in community between samples. Further, the relative position of the Sobs curve to that of the UGE curve can reflect the number of OTUs versus expectations had all samples been equal.



Although the Sobs curve for the sediment bacterial data set (Figure 2.20) began above the UGE curve it immediately went below, with the gap narrowing to equality at Station ENV236. Notable steps in the Sobs curve were noted where southern area Stations ENV205, ENV236 and ENV204 elicited up to 4.5 times more OTUs than the UGE curve, indicating a potential shift in bacterial community associated with these neighbouring very stations in shallow nearshore waters (≤16m depth). The Sobs and UGE curves continued to rise towards the end of the plot, suggesting that additional sampling may elicit additional OTUs, although the rate of increase was low.

Figure 2.20 OTU Accumulation Curve – Sediment Bacteria



The Sobs curve for the sediment infauna data set (Figure 2.21) began approximately in line with the UGE curve, dropping below with the addition of Station ENV177 and remaining there until the addition of Station ENV205. This station elicited 3.5 times more OTUs than the UGE curve, indicating a potential shift in infaunal community associated with sampling in shallow nearshore waters (15m depth). After Station ENV205, the Sobs curve dropped below once again, remaining roughly parallel with the UGE curve until the addition of the last sample.

Figure 2.21 OTU Accumulation Curve – Sediment Infauna

The Sobs curve for the sediment fish data set (Figure 2.22) once again began below the UGE curve. The most notable shifts in the community occurred at Stations ENV186, ENV215 and ENV221 where the Sobs curve was steepest relative to the UGE curve. Both the UGE and Sobs curve continued to rise after the addition of the last sample, indicating that further sampling along the route may elicit additional OTUs to those reported during the current sampling campaign.

Figure 2.22 OTU Accumulation Curve – Sediment Fish

2.9.4 Water eDNA Summary Statistics

Near surface and near seabed water samples from 34 stations were analysed for the presence of marine mammals and fish eDNA, excluding sharks and rays. Of the 68 samples, 58 were sampled with standard filters (including Station ENV204 surface and Station ENV205 bottom samples). The remaining 10 samples (from Stations ENV201, ENV237, ENV203 and ENV182 as well as Station ENV204 bottom and Station ENV205 surface samples) were sampled with a bacterial filter.

Fish

The standard filter from the surface sample at Station ENV199 and the bacterial filter from the surface sample at Station ENV182 failed to amplify any eDNA.

A total of 68 OTUs across 29 taxonomic groups based on family were identified from the standard filters data set with 34 OTUs across 16 taxonomic groups identified from the bacterial filters, giving a combined total of 73 OTUs across 30 groups based on family. The proportional contribution of these taxonomic groups to the overall structure of the route, from each filter type, are detailed in Table 2.20 and Table 2.21, with contributions presented as stacked bar charts for each station in Figure 2.23 and Figure 2.24.

Regarding the results derived from the standard filter, Gadidae (n=12) was the most detected taxonomic group across the survey area and accounted for 18% of OTUs. The next most detected taxonomic group was Pleuronectidae (n=8) accounting for 12% of OTUs. Fifteen taxonomic groups were represented by a single OTU (Table 2.20). A similar trend was observed in the comparison survey (Gardline, 2024b) with Gadidae being the most detected OTU, the second most detected OTUs in the comparison survey were Pleuronectidae and Gobiidae. Of the 68 fish OTUs, a total of 20 (29%) were present in a single sample; however, none was present in all samples. Like with sediment invertebrates, it is likely that the community has been under sampled.

Comparing to the results derived from the bacterial filter, Gadidae and Pleuronectidae remain the most detected OTUs with a total of 34 OTUs detected.

Marine Mammals

Standard filters from nine samples and the bacterial filters from seven samples failed to detect any species.

A total of six OTUs across four taxonomic groups based on family were identified from the standard filters data set with three of these OTUs across two taxonomic groups also identified from the bacterial filters. The proportional contribution of these taxonomic groups to the overall structure of the route, from each filter type, are detailed in Table 2.22 and Table 2.23 and presented for each station in Figure 2.25 and Figure 2.26.

Overall, Delphinidae (n=3) was the most detected taxonomic group along the route and accounted for 50% of OTUs. One OTU (*Halichoerus grypus*) was present in a single sample; however, none was identified in all samples.

A comparative taxonomic heat tree detailing the number of fish OTUs by filter type along the route down to the family rank is presented in Figure 2.27 and Figure 2.28. Summary statistics for water fish and marine mammal analyses by filter type are provided in Table 2.24 and Table 2.25.

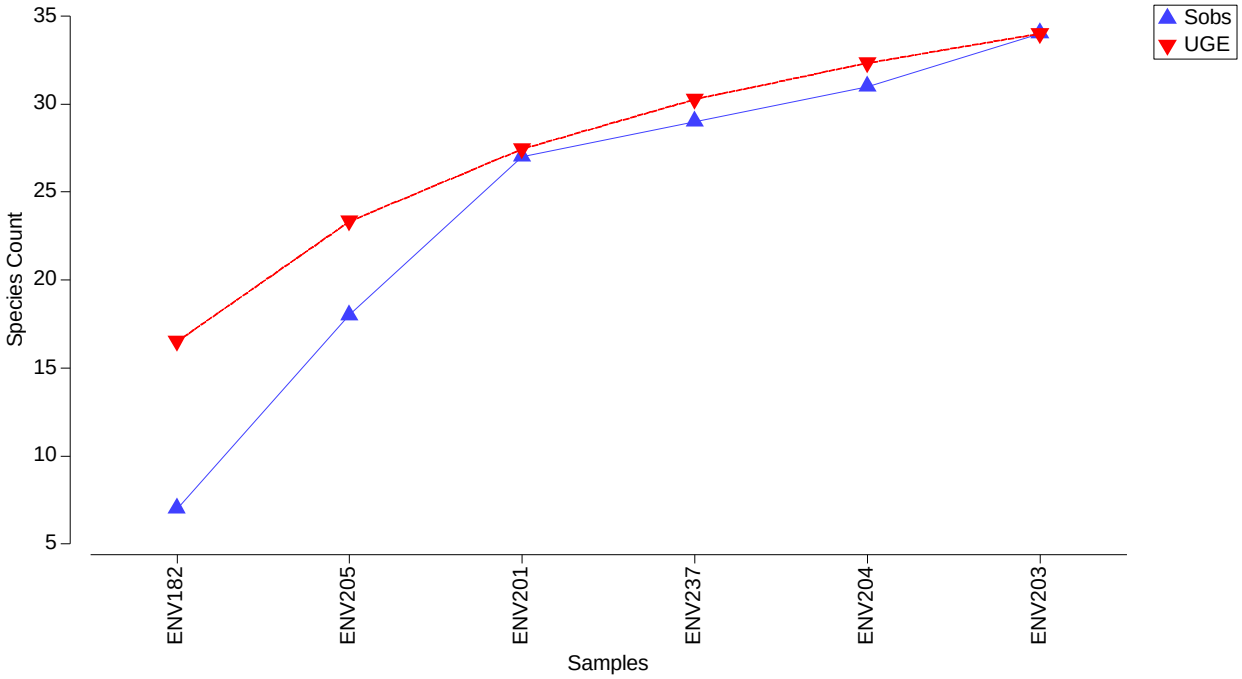
The OTU accumulation plots for fish water analysis data sets are presented in Figure 2.29 and Figure 2.30. The steepest rise in the Sobs curve for the standard filter fish (Figure 2.29) analysis data was with the addition of the nearshore Station ENV236 where eight new OTUs were added, indicating a shift in fish community in the shallowest waters sampled along the route (11m). The Sobs curve for the fish eDNA (Figure 2.30) extracted from the bacterial filter showed a relatively steep rise in the Sobs curve with the addition of nearshore Station ENV201 and ENV205 eliciting more new OTUs than the remaining stations. Both the UGE and Sobs curve continued to rise after the addition of the last sample indicating that further sampling may elicit additional taxa.



Given the relatively small data set, OTU accumulation plots for marine mammal eDNA would be of limited interpretive value and have therefore not been presented.

2.10 OTU Community Structure Using Multivariate Analyses

2.10.1 Sediment eDNA

Bacteria

The results of the CLUSTER analysis including SIMPROF analysis in the form of a Bray-Curtis similarity dendrogram and nMDS plot based on standardised data for the sediment bacteria samples are displayed in Figure 2.31 and Figure 2.32.

The CLUSTER analysis and resulting dendrogram (Figure 2.31) identified nineteen SIMPROF groups which comprised nine outliers (Stations ENV171, ENV172, ENV179, ENV185, ENV200, ENV206, ENV208, ENV217 and ENV237), nine closely related pairs (SIMPROF *b, d, e, g, l, k, n, p* and *q*) and one true cluster (SIMPROF *s*). Overall, samples were at least 29% similar to one another. The generally low similarities are potentially due to bacterial communities being far richer than equivalent metazoan communities and less discriminately bound to the sediment given their established variation with both overlying water quality along with direct sediment physico-chemistry (Allison & Martiny, 2008; Frühe *et al.*, 2021). However, they still provide a suitable sensitive receptor to environmental pressures for environmental monitoring (Horton *et al.*, 2019). At a nominal Bray-Curtis similarity of 40%, the dendrogram could be separated into two broad groups A (containing all samples from water depths <30m) and B and one outlier (*c*, Station ENV171, one of the deepest stations).

The nMDS ordination of the sediment infauna data set (Figure 2.32) revealed a similar pattern to the CLUSTER analysis with a stress value of 0.09, this can be considered a good two-dimensional representation of rank (dis)similarities and the overall pattern observed in the data set.

Examination of the sediment bacteria data set together with the results of the SIMPER analyses at a group level showed differences due to subtle variations in taxa community structure within particular SIMPROF groups.

Infauna

The results of the CLUSTER analysis including SIMPROF, in the form of a Bray-Curtis similarity dendrogram and nMDS plot based on standardised data for the sediment invertebrates samples are displayed in Figure 2.33 and Figure 2.34.

The CLUSTER analysis and resulting dendrogram identified ten SIMPROF groups which comprised three outliers (Stations ENV206, ENV222 and ENV233), two closely related pairs (SIMPROF *h* and *i*) and five true clusters (SIMPROF *a, c, d, e* and *j*). All samples were considered more dissimilar than similar and grouped at <50% similarity.

The nMDS ordination of the sediment infauna data set (Figure 2.33) revealed a similar pattern to the CLUSTER analysis with a stress value of 0.23, this should be treated with caution as a two-dimensional representation of rank (dis)similarities and overall pattern observed in the data set.

Examination of the sediment infauna sample data together with the results of the SIMPER analyses at a group level showed differences due to subtle variations in taxa community structure within particular SIMPROF groups.

Fish

The results of the CLUSTER analysis including SIMPROF analysis in the form of a Bray-Curtis similarity dendrogram and nMDS plot based on standardised data for the sediment fish samples are displayed in Figure 2.35.

The CLUSTER analysis and resulting dendrogram identified a single SIMPROF group. Samples were considered more dissimilar than similar as they grouped at *c.*3% similarity.

The nMDS ordination of the sediment fish data set (Figure 2.36) revealed a similar pattern to the CLUSTER analysis with a stress value of 0.06, this is considered a good two-dimensional representation of rank (dis)similarities and overall pattern of the data set.

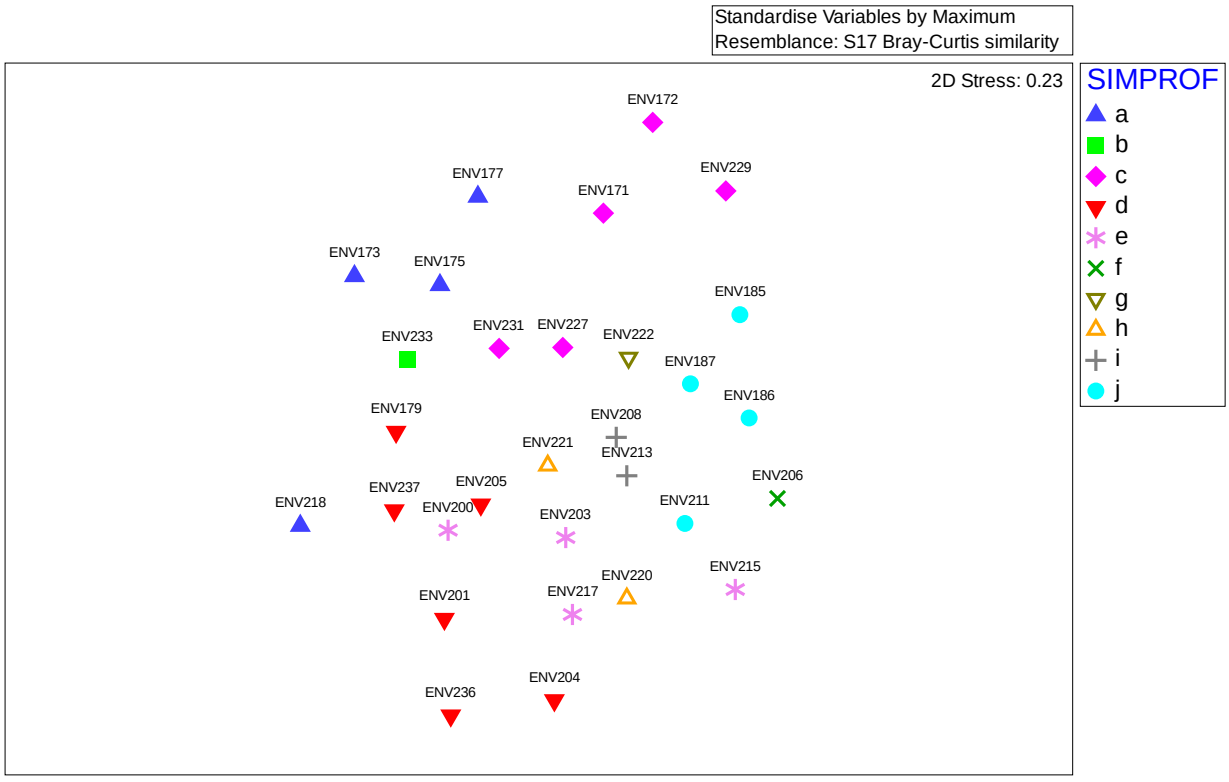

Figure 2.35 Bray-Curtis Similarity Dendrogram of Sediment Fish Data

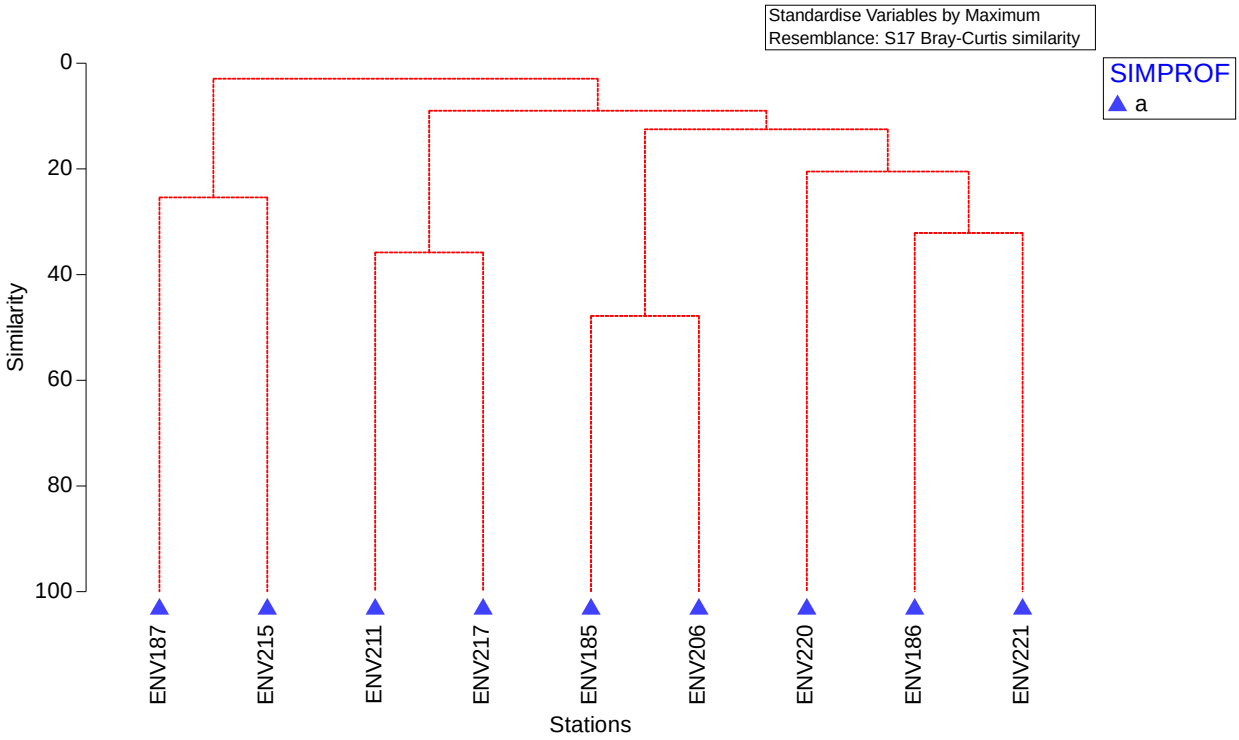

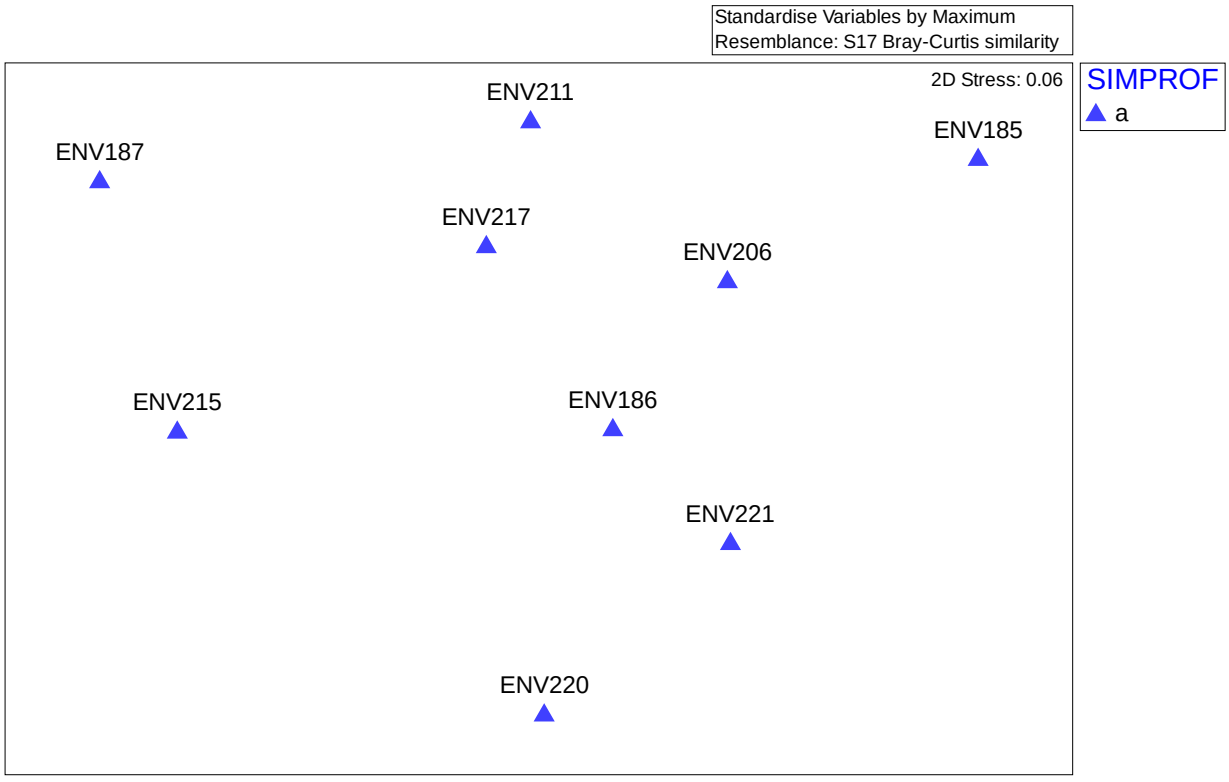

Figure 2.36 nMDS Ordination Plot of Sediment Fish Data

2.10.2 Water eDNA

Fish (Standard Filter)

The results of the CLUSTER analysis including SIMPROF analysis in the form of a Bray-Curtis similarity dendrogram and nMDS plot based on standardised data for the water fish samples are displayed in Figure 2.37 and Figure 2.38.

The CLUSTER analysis and resulting dendrogram (Figure 2.37) identified one closely associated pair of samples from the northern area (SIMPROF *a*) and three true clusters including SIMPROF *d* which comprised the three shallowest stations (ENV204, ENV205 and ENV236). Overall, samples were 12 to 60% similar to one another. The nMDS ordination of the water fish (standard filter) data set (Figure 2.38) revealed a similar pattern to the CLUSTER analysis with a stress value of 0.21, this two-dimensional representation of rank (dis)similarities and overall pattern of the data set should be treated with some caution.

Examination of the sediment fish sample data together with the results of the SIMPER analysis indicated that several OTUs contributed to the groupings and separation of the samples.

Fish (Bacterial Filter)

The results of the CLUSTER analysis including SIMPROF analysis in the form of a Bray-Curtis similarity dendrogram and nMDS plot based on standardised data for the sediment fish samples are displayed in Figure 2.39 and Figure 2.40.

Partly due to the small sample size, the CLUSTER analysis and resulting dendrogram (Figure 2.39) identified a single SIMPROF group. Samples were considered more dissimilar than similar each grouping at <50% similarity. The nMDS ordination of the water fish (bacterial filter) data set (Figure 2.40) revealed a similar pattern to the CLUSTER analysis with a stress value of 0 can be considered a perfect representation of the rank (dis)similarity and overall pattern of the data.

Marine Mammal (Standard Filter)

The results of the CLUSTER analysis including SIMPROF analysis in the form of a Bray-Curtis similarity dendrogram and nMDS plot based on standardised data for the water marine mammal samples are displayed in Figure 2.41 and Figure 2.42. Due to the limited number of target OTUs detected in the samples, the CLUSTER analysis and resulting dendrogram identified a single SIMPROF group.

The nMDS ordination of the water marine mammal data set (Figure 2.42) revealed a similar pattern to the CLUSTER analysis with a stress value of 0.01, this is considered a near perfect two-dimensional representation of rank (dis)similarities and overall pattern of the data set. Of the samples where target OTUs were detected, Station ENV179 and ENV218 were the most distinct as they recorded unique detections of *Halichoerus grypus* and *Grampus griseus*, respectively.

Marine Mammal (Bacterial Filter)

The results of the CLUSTER analysis including SIMPROF analysis in the form of a Bray-Curtis similarity dendrogram and nMDS plot based on standardised data for the water marine mammal samples are displayed in Figure 2.43 and Figure 2.44. Due to the limited number of stations and target OTUs detected in the samples the CLUSTER analysis and resulting dendrogram identified a single SIMPROF group. Samples were considered more dissimilar than similar as they grouped at <30% similarity.

The nMDS ordination of the water marine mammal data set (Figure 2.44) revealed a similar pattern to the CLUSTER analysis with a stress value of 0, this is considered a perfect two-dimensional representation of rank (dis)similarities and overall pattern of the data set.

2.11 Multivariate Comparison of Metabarcoding Results to Physico-Chemical Data

The multivariate patterns for all seven DNA data sets were individually compared to the 30 station physico-chemical data to determine if any correlations were present. This was not possible for five stations due either to no grab sampling being attempted (ENV182, ENV199, ENV219) or to unsuccessful grab sampling (ENV197, ENV198).

BIO-ENV analysis conducted on the seven DNA data sets against the 30 station physico-chemical data set identified;

- A sub set of one variable; Ni, showed a 72% correlation with the sediment trace bacteria DNA multivariate pattern.
- A sub set of two variables; percentage fines and Zn, showed a 33% correlation with the sediment infauna DNA multivariate pattern.
- A sub set of one variable; mean particle diameter, showed a 15% correlation with the sediment fish DNA multivariate pattern.
- A sub set of one variable; Ni, showed a 49% correlation with the water fish (standard filter) DNA multivariate pattern
- A sub set of two variables; percentage sand and percentage gravel, showed a 26% correlation with the water fish (bacterial filter) DNA multivariate pattern.
- A sub set of one variable; Ni, showed a 31% correlation with the water marine mammal (standard filter) DNA multivariate pattern
- A sub set of one variable; As, showed a 55% correlation with the water marine mammal (bacterial filter) DNA multivariate pattern

Further sampling including additional stations and replication would allow further investigation of the relationship between DNA data and the physico-chemical variables. As a result of the current sample sizes for each of the seven data sets with amplified and target DNA present (sediment bacterial; n=30; sediment infauna; n=30; sediment fish; n=9; water fish (standard filter); n=30, water fish (bacterial filter); n=6, water marine mammal (standard filter); n=29 and water marine mammal (bacterial filter); n=5) and the use of single DNA replicates per station the statistical robustness of the analysis patterns are limited and may be obscured.

2.12 Macrofaunal Interpretation

2.12.1 Overview

Two 0.1m^2 faunal samples (MFA and MFB) were collected from 49 stations, one of which (the MFA sample) was worked up and the second retained and appropriately stored as a spare. All faunal samples were screened through a 0.5mm mesh sieve. Before analysing the data set provided by the laboratory, several taxa were removed as per our stated methods; however, all records, regardless of whether they were included in statistical analyses, are listed in Appendix J.

2.12.2 Summary of Notable Species

A total of four *P. phosphorea*, recording a biomass of 0.8408g and eleven *Virgularia mirabilis* with a biomass of 0.012g, were recorded across ten stations (*P. phosphorea* at Stations ENV230, ENV231 and ENV233 and *V. mirabilis* at Stations ENV214, ENV215, ENV216, ENV217, ENV220, ENV221, ENV222) along the route. Sea pens are included as a defining species of the 'Sea pen and burrowing megafauna communities' habitat as defined by OSPAR (2010).

Sixty juvenile individuals of *A. islandica* with a combined biomass of 0.0322g and an average biomass of <0.001g per individual, were recorded along the route, being present at 19 stations. This is a long-lived species with a slow growth rate and is on the OSPAR (2008) list of threatened and/or declining species and habitats. However, *A. islandica* is commonly found in this area of the North Sea, where populations of 40- to 80-year-old specimens have been recorded, with a substantial proportion over 100 years old (OSPAR, 2009b).

2.12.3 Summary Statistics

A total of 22583 individuals representing 353 taxa and 137.4817g of biomass were recorded from across the 49 sampled stations. Of these, juveniles accounted for 3480 individuals from 18 taxa and 2.8878g of biomass; representing 15% of individuals, 5% of the taxa and 2% of the biomass recorded. Juveniles, although a valid part of the community, are ephemeral in their nature due to high levels of mortality and can temporarily disturb the normal balance of relative abundance amongst species (and consequently measures of diversity). A RELATE analysis was conducted in PRIMER to determine whether the presence of juveniles caused significant variation between the rationalised full and adult only faunal community structure. The test showed that the two data sets were 98% similar, indicting no significant difference between the two faunal communities. When ranked by abundance, one juvenile taxon (Spatangoida) was ranked within the top ten taxa. OSPAR (2017a) recommends that should juvenile taxa appear among the top ten taxa in the data set, statistical analysis of the faunal community should be conducted both with and without juveniles to illustrate their influence on the faunal community. Consequently, the adult data set will be presented within this report, with the full data set discussed where relevant.

The data sets (full and adult) were divided into five taxonomic groups: Annelida (Polychaeta), Arthropoda (Malacostraca), Mollusca, Echinodermata and Others. The Others category comprised Annelida (Clitellata and Sipuncula), Arthropoda (Pycnogonida), Cnidaria (Hexacorallia, Octocorallia), Hemichordata (Enteropneusta), Nemertea, Platyhelminthes, Priapulida and Phoronida. The absolute and proportional contributions of these five taxonomic groups to the overall community structure of adult and full fauna are summarised in Table 2.26. The contributions of each taxonomic group to the total individuals, taxa and biomass are illustrated as stacked bar charts in Figure 2.45, Figure 2.46, and Figure 2.47.

In the adult only data set, Annelida (Polychaeta; n=8205) was the most abundant taxonomic group accounting for 42% of the individuals, 37% of the taxa and 20% of the biomass. Overall, Annelida had the highest number of individuals recorded and was the most abundant group at 69% (n=34) of stations, most notably at the stations with muddy sand in the central area. *Paramphinome jeffreysii* (n=2202) accounted for 27% of annelid abundance, 12% of the overall adult abundance but less than 1% of the total biomass. The polychaete *P. jeffreysii* is one of the most encountered polychaetes in the North Sea and is often abundant in grab samples. Abundance of this species in the North Sea is reportedly increasing in general (Rees *et al.*, 2007). Gage (2001) showed that polychaetes in Atlantic waters consistently dominate soft bottom benthos from the continental shelves to abyssal plains and over 50% of macrofaunal individuals generally comprise polychaete worms, indicating that the survey area is typical for the region.

Overall, the second most abundant group was Mollusca (n=5760), accounting for 30% of total individuals, 21% of adult taxa and 27% of the adult biomass. Figure 2.45 shows that Mollusca was the most populous group at five nearshore stations. A single taxon; *Spisula* contributed 36% of the Mollusca abundance, 11% of the overall adult abundance and 2% of the adult biomass. Arthropoda (Malacostraca) accounted for 13% of adult individuals, however it accounted for 30% of the adult taxa indicating that this taxonomic group was relatively diverse.

Of the 353 adult and juvenile taxa recorded along the route, none was present at every station. A total of 91 taxa (26% of total taxa) were recorded at a single station, of those 74 (21% of total taxa) were represented by a single individual. It is generally accepted that ecological communities which are frequently

subjected to a local disturbance or contamination events will be dominated by a limited number of tolerant taxa, which will be represented by high individual abundances (Clarke & Warwick, 2006). There was no evidence of localised super abundance of pollution tolerant taxa in this survey suggesting a reasonably diverse community that has been subjected to relatively little disturbance or contamination.

Table 2.26 Contribution of Gross Taxonomic Groups

Group	Current Survey						Gardline (2024b)

Results in blue are from comparable surveys, see 1.3.

When considering the adult data set in terms of biomass, a total wet weight of 134.5939g was recorded along the route (Table 2.26). As was to be expected, Echinodermata (n=57.3946g) was the dominant group by weight and accounted for 43% of the sampled biomass along the route, with most notable contributions occurring at Station ENV173 and ENV228 due to single specimens of *Echinocardium cordatum* and *Brissopsis lyrifera,* respectively. Mollusca was the second ranked by weight and accounted for 27% of the sampled biomass. Proportional contributions by biomass were similar to the comparison survey (Gardline, 2024b).

Figure 2.45 Contributions of Gross Taxonomic Groups - Individuals

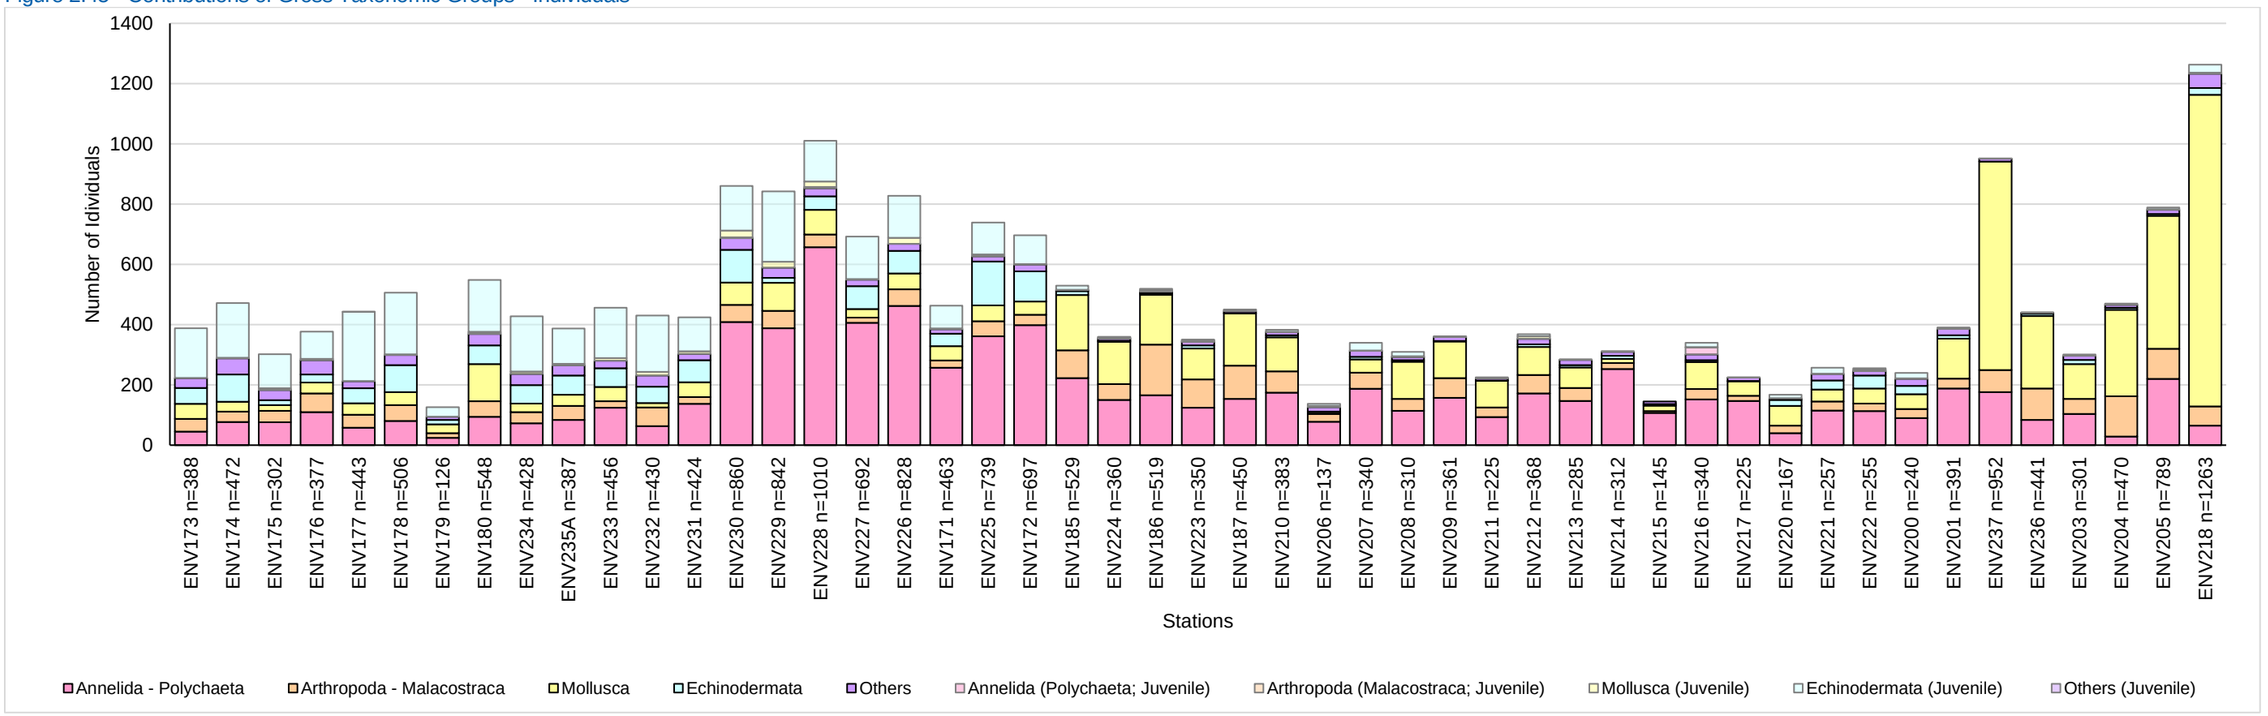

Figure 2.46 Contributions of Gross Taxonomic Groups – Taxa

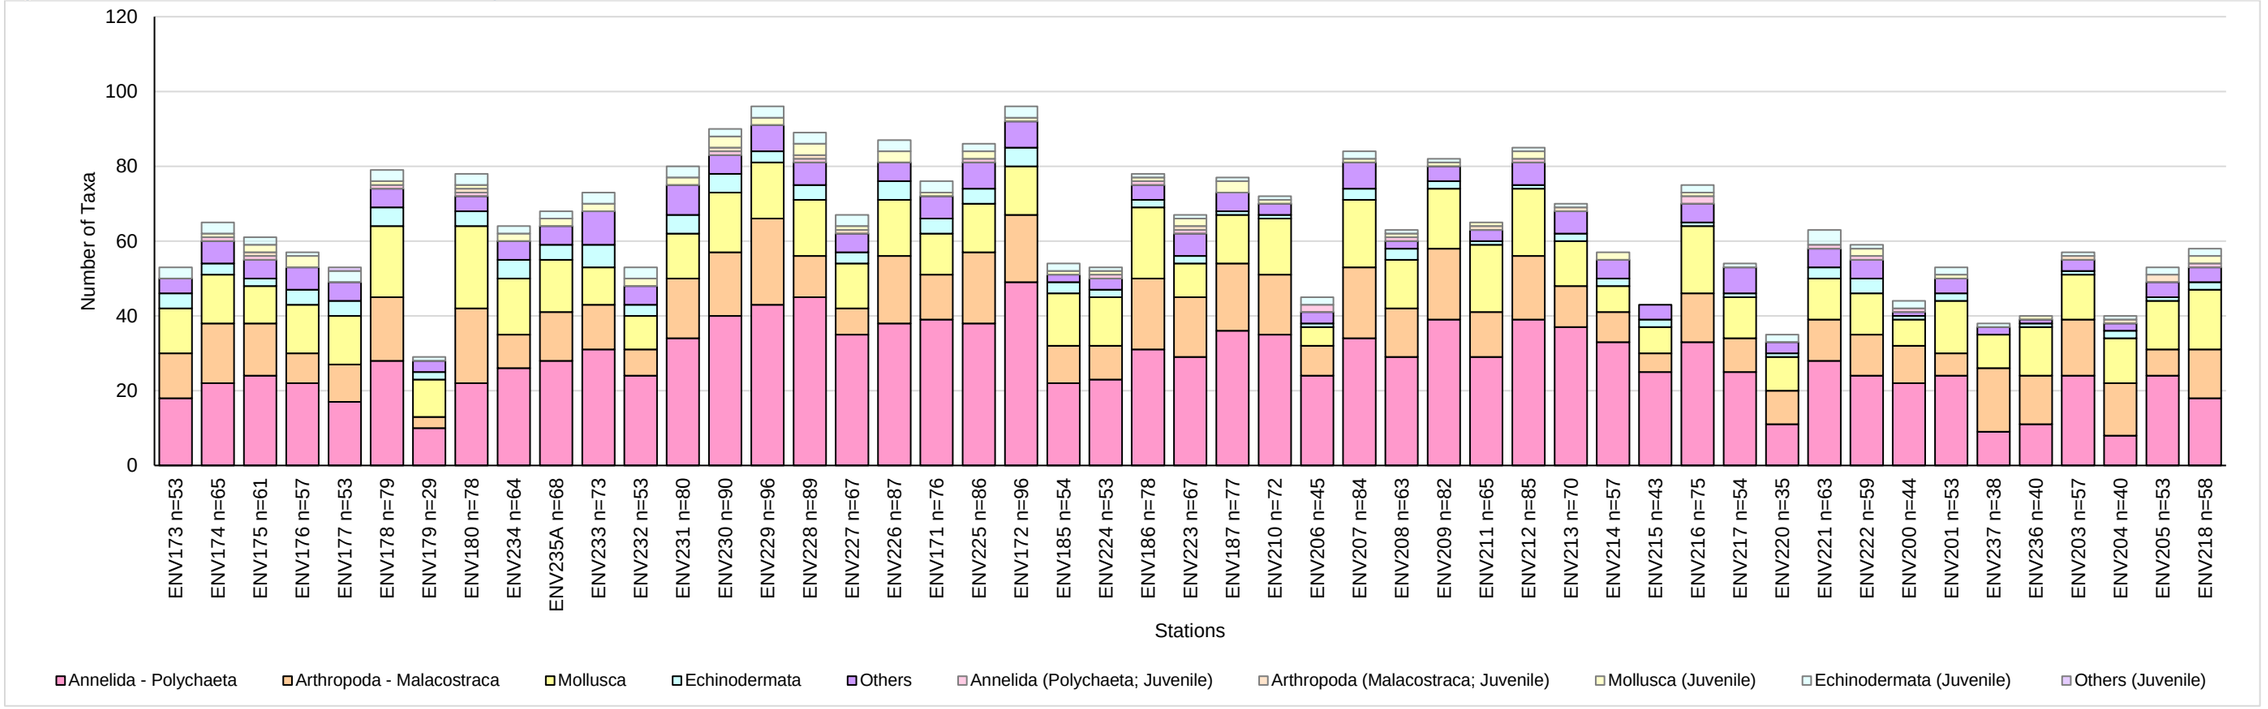

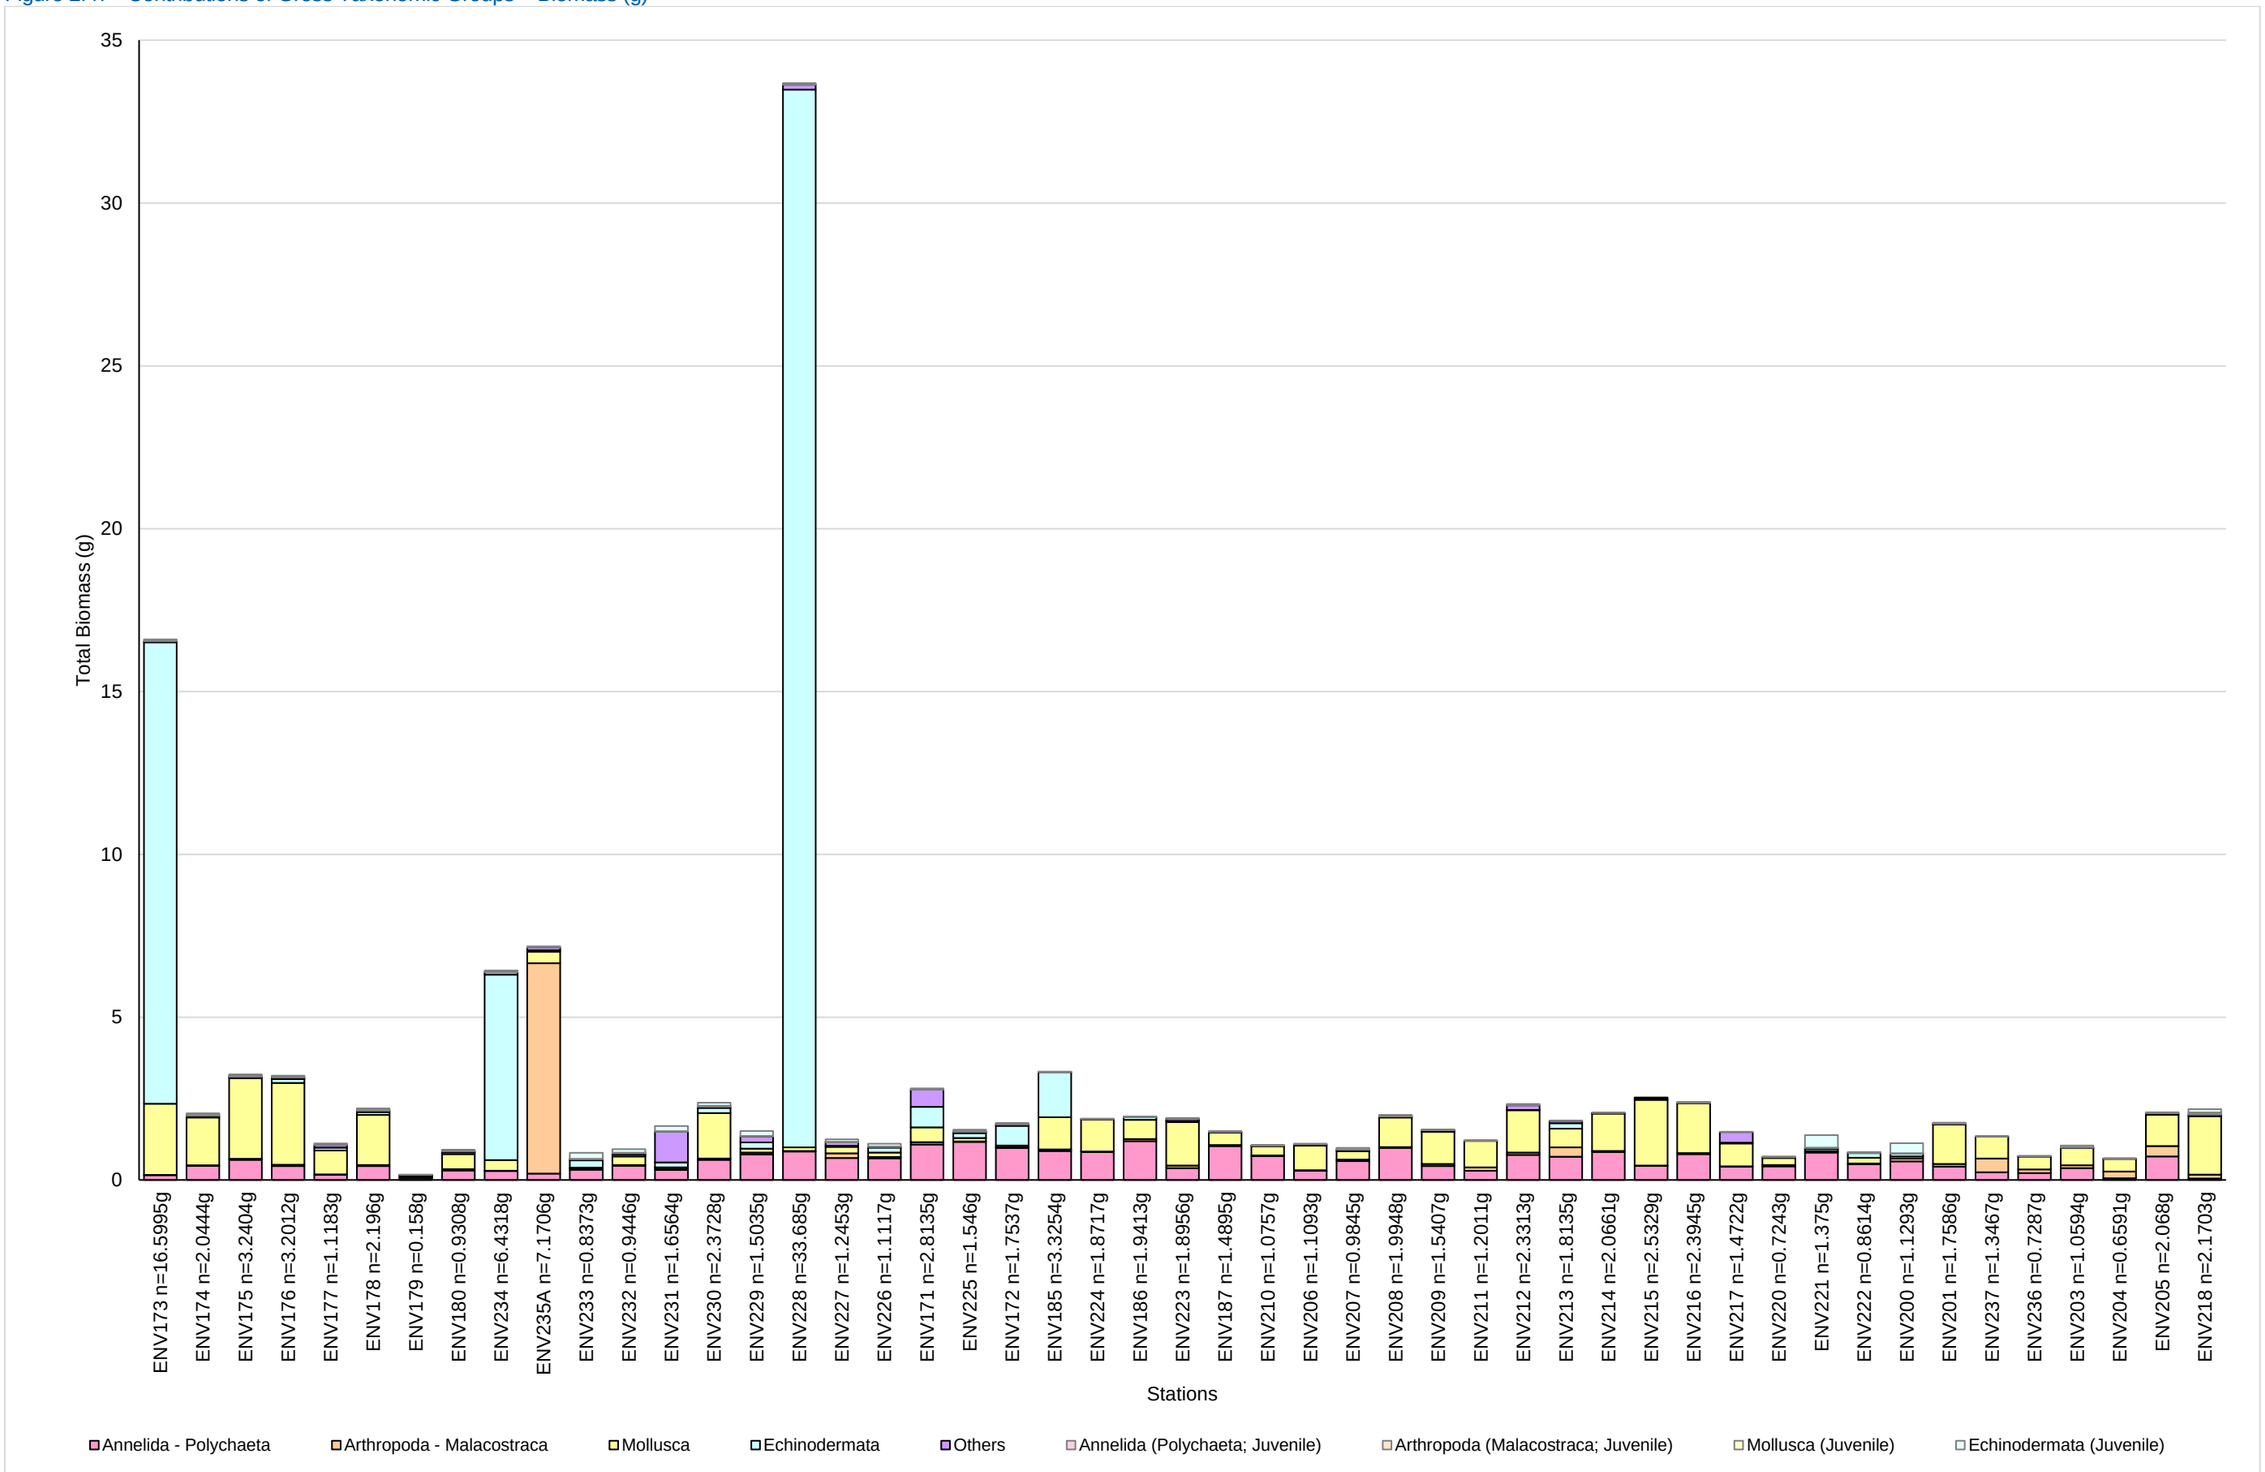

Figure 2.47 Contributions of Gross Taxonomic Groups – Biomass (g)

Species ranking provides additional information on the dominance structure of the faunal community along the route. Results based on abundance are presented in Table 2.27, with biomass presented in Table 2.28. In the adult only data set, the top 10 ranking taxa comprised four Annelida, two Echinodermata, three Mollusca and two Others. In the full fauna data set, the Juvenile taxon (Spatangoida) was the top-ranking taxon and Edwardsiidae was no longer ranked within the top ten.

Results of the species ranking and fidelity scores can give a further indication of a taxon's distribution, with results ≥0.8 and ≤1.2 indicating a generally even distribution of a taxon, whilst values outside of this range represent a patchier distribution, which is to be expected given the geographical spread of the stations. Of the top-ranking adult taxa from the abundance data set (Table 2.27), only one taxon (*Ophiocten affinis*) fell within this range, indicating an even distribution. Of the nine taxa potentially exhibiting a patchier distribution, two taxa were notably more abundant than their rank by score would suggest, consistent with localised high abundances of these taxa. Specifically, *P. jeffreysii* was particularly abundant at the deeper, muddy sand stations of the central area whereas *Spisula* was most populous at the shallowest stations nearshore.

The faunal community for the route was consistent with that previously recorded in the Gardline (2024b) comparison survey. Seven of the adult only top ten listed taxa were also ranked within the comparison survey adult only data set.

When considering species ranking based on the adult biomass data set (Table 2.28), there was notable reordering in terms of species ranking compared to the abundance data set. Along the route, all top-ranking taxa in the abundance data set were replaced by a generally more patchily distributed group of six relatively larger polychaetes, five molluscs and four echinoderms and an arthropod.

Taxa are coloured according to their taxonomic groupings: Annelida (Polychaeta), Mollusca, Echinodermata.
Taxa in **bold** were in the top ten ranked species (by score) in the Gardline (2024b) comparison survey.

A species accumulation plot for the adult only data set is presented in Figure 2.48. The Sobs curve began below the UGE curve indicating that fewer taxa were elicited than average from the samples in the northern and central areas. The Sobs curve rose relatively steeply when stations in the deeper, muddy sand of the central area were added (*e.g.* ENV229 and ENV172), as well as at Station ENV186, which was the first muddy sand station in the southern area to be added.

Both the UGE and Sobs curve continued to rise with the addition of the last sample, reflecting that further sampling along the route may elicit additional taxa. The species accumulation curve for the full faunal data set shows an almost identical pattern to the adult only data set suggesting it provides an accurate representation of the overall survey area and the taxa present. The pattern presented in the current survey was very similar to that shown in the comparison survey (Gardline, 2024b).

Figure 2.48 Adult Data Set Species Accumulation Curve

2.12.4 Diversity using Univariate Statistics

The full and adult data sets were analysed to provide to the total number of individuals and taxa, Shannon-Weiner diversity index (H'); calculated with logarithm base 2 (Shannon & Weaver, 1949), Pielou's evenness (*J'*), Simpson's dominance (λ) and Margalef's Richness index (*d*). Increasing values of the Shannon-Weiner diversity index correspond to increasing diversity of the community. Values for Pielou's evenness and Simpsons dominance both range from 0 to 1, with 1 indicating an even community for the former and a dominated community for the latter. Margalef's index takes account of the number of species present for a given number of individuals. Detailed information on the methods for univariate statistics are presented in Appendix B.

The univariate statistics for the adult only data set and summary statistics for the full fauna data set are displayed in Table 2.29. The number of taxa were higher (t-test $p<0.05$) than the comparison survey (Gardline, 2024b), while the number of individuals was consistent with (t-test $p>0.05$) the comparison survey.

Shannon-Weiner diversity values ranged from 2.24 at Station ENV237 to 5.73 at Station ENV207 with a mean of 4.57 (±0.70SD), which is broadly in line with the background of 4.36 (n=144) for the CNS (UKOOA, 2001).

These values are also within range recorded in the comparison survey (Gardline, 2024b). Margalef's index along the route showed a relatively large range in species richness between stations; Station ENV237 had the lowest index (5.25) while Station ENV172 had the highest index (14.23).

Rarefaction (ES(24)) estimated that across 24 individuals, the number of taxa would range from 6 at Station ENV237 to 19 at Station ENV207, consistent with the range observed for the comparison survey (Gardline, 2024b). This range of values together with Pielou's Evenness were positively correlated with percentage gravel (Spearman's $p<0.01$, Appendix F).

Pielou's evenness suggested the community was overall more even than uneven, with values ranging from 0.43 at Stations ENV218 and ENV237 to 0.92 at Station ENV179 with a mean of 0.78 (±0.11SD). This was further supported by the low Simpson's dominance values for diversity which ranged from 0.03 at Stations ENV207 and ENV213 and 0.45 at Station ENV218. Samples showed similar values for diversity indices when compared to the UKOOA (2001) averages for the CNS, indicating that values were as expected for the region.

To quantitatively assess the changes in diversity across the wider region, beta diversity between the current and comparison survey (Gardline, 2024b) was calculated using the Jacquard similarity index (Jaccard, 1908). Beta diversity indices measure the change in diversity of taxa from one environment to another by calculating the number of taxa that are different between the two environments. The Jacquard (1908) similarity index ranges from 0 to 1 with 1 indicating 100% similarity in the species composition of the community; however, these values do not reflect relative abundance differences. With a resulting index of 0.57 this suggests there was some degree of similarity between the current survey and comparison survey.

Table 2.29 Faunal Univariate Statistics

2.12.5 Faunal Community Structure using Multivariate Analyses

In comparison to the univariate statistics, multivariate analyses enable subtle trends within the full and adult data sets to be identified. Multivariate analyses were performed on the rationalised data using PRIMER v7. Bray-Curtis similarity matrices were produced based on the square root transformed abundance data sets. This transformation was chosen to down-weight the influence of the numerically dominant taxa and to ensure that the intermediately abundant and sparse species contributed to the multivariate pattern.

A SIMPROF permutation test was conducted in conjunction with CLUSTER analyses and the results illustrated on a dendrogram. The Bray-Curtis similarity dendrogram and nMDS plots for the adult only abundance data are presented in Figure 2.49 to Figure 2.52.

The CLUSTER analysis and dendrogram for the adult only abundance data (Figure 2.49) identified thirteen SIMPROF groups comprising eight clusters (SIMPROF *b, c, e, g, h, k, l* and *m*), two closely associated pairs (SIMPROF *d* and *j*) and three outliers (Stations ENV179, ENV217 and ENV218). At a nominal Bray-Curtis similarity of 35%, the dendrogram could be separated into three broad groups aligned with geographical area (Figure 2.50), water depth and sediment type. Most distinct was the faunal community within broad group A, which comprised all southern area stations in water depths of <40m other than the gravelly Station ENV222, which formed Broad Group C with all other southern area stations.

The nMDS ordination (Figure 2.51) revealed a similar pattern to the CLUSTER analysis and with a stress value of 0.12, it can be considered a useful representation of overall rank (dis)similarities in the data. The key taxa responsible for the separation of these broad groups are displayed in Table 2.30, based on SIMPER analysis and a review of the raw data. Bubbles representing the relative abundance of top ten ranked species; Amphiuridae, *P. jeffreysii, S. bombyx* and *Spisula*, are shown in Figure 2.52.

The CLUSTER analysis and dendrogram for the adult only biomass data identified twelve SIMPROF groups (Figure 2.53) which comprised three outliers (Stations ENV217, ENV214 and ENV179), two closely associated pairs (SIMPROF *a* and *i*) and seven true clusters (SIMPROF *b, c, e, f, h, j* and *l*). Similar to the abundance data, the dendrogram could be separated into three broad groups aligned with geographical area, water depth and sediment type. However, Broad group A comprised all southern area stations in water depths of <40m including gravelly Station ENV222.

With a stress value of 0.13, the nMDS can be considered a useful 2D representation of rank (dis)similarities of the overall pattern observed in the data set. The key taxa responsible for the separation of the SIMPROF groups are displayed in Table 2.31, based on SIMPER analysis and a review of the raw data. Bubbles representing the relative abundance of top ten ranked species; *O. acuminata, T. tricarinata, A. nitida* and *Spisula* are shown in Figure 2.54.

Table 2.30 Taxa Influencing Adult Abundance SIMPROF Variation

Stations	Broad Group	Bray-Curtis Dissimilarity (%)	Taxa Affecting Separation from Remaining Stations (and % contribution to dissimilarity)
ENV201, ENV203, ENV204, ENV205, ENV218, ENV200, ENV220, ENV221, ENV236 and ENV237 *vs* all remaining stations	Broad Group A *vs* Broad Groups B,C	78.94	• Higher abundance of *Spisula*, ***Spiophanes bombyx***, ***Abra***, *Chamelea striatula*, *Obtusella intersecta* (*c*. 14.1%) • Lower abundance of **Amphiuridae** (*c*. 1.5%) • Absence of ***P. jeffreysii*** (*c* .2.5%) • Presence of *Diastylis bradyi* (*c*. 2.2%)
ENV171 to ENV180 and ENV225 to ENV235A *vs* ENV185 to ENV187, ENV206 to ENV217 and ENV222 to ENV224	Broad Group B *vs* Broad Group C	70.37	• Higher abundance of ***P. jeffreysii***, **Amphiuridae**, ***Ophiocten affinis***, *Scoloplos armiger* and **Edwardsiidae** (*c*. 10.9%) • Lower abundance of ***Chaetozone pseudosetosa***, ***Ennucula tenuis***, *Abra nitida*, *Lumbrineris aniara, Ophelina acuminata* and ***Abra*** (c. 9.4%)

Taxa in **bold** are included in the top ten ranked taxa (adult abundance data)

Table 2.31 Taxa Influencing Adult Biomass SIMPROF Variation

Stations	Broad Group	Bray-Curtis Dissimilarity (%)	Taxa Affecting Separation from Remaining Stations (and % contribution to dissimilarity)
ENV201, ENV203 to ENV205, ENV200, ENV218, ENV220 to ENV222, ENV236 and ENV237 *vs* all remaining stations	Broad Group A *vs* Broad Groups B,C	76.49	• Absence of *P. jeffreysii* (*c*. 1.1%) • Presence of *D. bradyi* and *Mactra stultorum* (*c*. 3.0%) • Higher biomass of ***Spisula***, ***C. striatula***, ***N. hombergii***, ***O. acuminata***, *Lagis koreni*, *Ampelisca brevicornis*, ***L. aniara***, *S. bombyx* and *Chaetozone christiei* (*c*. 13.1%) • Lower biomass of ***A. filiformis***, ***S. armiger*** and *Galathowenia* (c. 4.2%)
ENV185 to ENV187, ENV206, ENV207 to ENV217, ENV223 and ENV224 *vs* ENV171 to ENV180 and ENV225 to ENV235A	Broad Group B *vs* Broad Group C	70.24	• Presence of ***T. tricarinata*** (c. 1.9%) • Higher biomass of ***A. nitida***, *C. pseudosetosa*, ***O. acuminata***, ***L. aniara***, *L. koreni* and *Glycera unicornis* (c. 8.4%) • Lower biomass of ***C. striatula***, ***S. armiger***, ***A. filiformis***, ***P. affinis***, ***N. hombergii***, *Phoronis* and *Antalis entalis* (c. 9.4%)

Taxa in **bold** are included in the top ten ranked taxa (adult biomass data)

2.12.6 Multivariate Comparison of Faunal and Physico-Chemical Data Sets

A sub set of the macrofaunal community adult data set was compared to the 30 station physico-chemical data in PRIMER v7 to determine if any patterns in the faunal community correlated with the environmental factors assessed. A BIO-ENV test was run on the sub set of the adult only abundance data for stations which also acquired the MMO physico-chemical samples.

The BIO-ENV analysis identified a significant 53% correlation between the adult abundance multivariate pattern with three physico-chemical variables: Ni and Zn concentrations and the percentage of fines. This suggests that along the route, shifts in the faunal community reflect variations in the physical sediment characteristics and associated sediment metal concentrations. Consistent with the findings of the Spearman's rank correlation showing significant positive correlations between both Ni and Zn and the percentage of fines (Spearman's $p<0.01$, Appendix F)

2.13 EUNIS Habitat Classification

For the 49 stations with PSA and macrofauna samples, results of the EUNIS habitat classification (EEA, 2019) based on these data are summarised in Table 2.32 and detailed in full in Appendix K. These data were reviewed alongside geophysical and seabed imagery data to assign a EUNIS habitat code to each distinct macrofaunal community group identified in Section 2.12 (Figure 2.49; Broad Groups A to C). It should be noted that due to the inclusion of macrofaunal data, there are some differences to the EUNIS level 4 biotopes reported in the Habitat Assessment (Gardline, 2025).

All habitats observed along the route related to EUNIS Level 1 environment 'Marine benthic habitats' (EUNIS habitat code M). One level two broad habitat was identified as infralittoral (EUNIS habitat type code MB) and two habitats as offshore circalittoral (EUNIS habitat type code MD).

The following level 3 main habitats were present along the route:

- Areas of sand with patches of gravel and cobbles, generally below 20m were assigned EUNIS habitat MB5 (infralittoral sand)
- Areas of mud to muddy sand generally below 60m water depth, were assigned EUNIS habitat MD5 (offshore circalittoral mud)

EUNIS level 4 main habitat classification was determined considering the habitat descriptions of both the EUNIS website and associated documentation (Davies *et al.*, 2004; EEA, 2019). Along the route, the following EUNIS biotope complexes were identified:

- EUNIS biotype MB523 (Faunal communities of full salinity Atlantic infralittoral sand) described as sands which occur in shallow water, either on the open coast or in tide-swept channels of marine inlets. Incorporating both clean sands and non-cohesive muddy sand (with 5% to 20% silt/clay).
- EUNIS biotype MD621 (Faunal communities of Atlantic offshore circalittoral mud) described as sublittoral muds, occurring below moderate depths of 15-20m, either on the open coast or in marine inlets such as sea lochs.

In addition, three level 5 EUNIS biotope complexes were identified:

- EUNIS biotope MB5238: *Spisula subtruncata* and *Nephtys hombergii* in Atlantic infralittoral muddy sand, which is described as shallow non-cohesive muddy sands, in fully marine conditions, a community characterised by the bivalve *S. subtruncata* and the polychaete *N. hombergii* may occur. The sediments in which this community is found may vary with regard to silt content, but they generally have less than 20% silt/clay and in some areas may contain a degree of shell debris.

- EUNIS biotope MD6217: *Levinsenia gracilis* and *Heteromastus filiformis* in Atlantic offshore circalittoral mud and sandy mud, which is described as deep offshore mud and sandy mud, where the community is characterised by the polychaetes *L. gracilis* and *H. filiformis* may occur. Other important taxa may include *P. jeffreysii*, *Nephtys hystricis* and *Nephtys incisa*, *S. kroyeri*, *Orbinia norvegica*, *Terebellides stroemi*, *Thyasira gouldi* and *Thyasira equalis*. Burrowing megafauna such as *Calocaris macandreae* may also be found in this biotope. This biotope has been found in the central and northern North Sea.
- EUNIS biotope MD6218: *Paramphinome jeffreysii*, *Thyasira spp*. and *Amphiura filiformis* in Atlantic offshore circalittoral sandy mud, which is described as deep, offshore cohesive sandy mud communities characterised by the polychaete *P. jeffreysii*, bivalves such as *Thyasira equalis* and *Thyasira gouldi* and the brittlestar *A. filiformis*.

Table 2.32 EUNIS Habitat Classification

Adult Station Multivariate Cluster	Station	Water Depth (m)	EUNIS Folk Classification from PSA Data	EUNIS Level 3	EUNIS Habitat Classification		EUNIS Habitat Type
					Level	Code	
Broad Group A	ENV220	37	Mud and sandy mud	MB5	Level 5	MB5238	*Spisula subtruncata* and *Nephtys hombergii* in Atlantic infralittoral muddy sand
	ENV221	32	Mud and sandy mud				
	ENV200	26	Mud and sandy mud				
	ENV201	22	Mud and sandy mud

APPENDIX A FIELD SAMPLING LOGS

Gardline — Seafloor Sampling Positioning Summary

Job No	59294			Vessel	MV *Ocean Reliance*						
Client	Morven Offshore Wind Limited			Vessel Reference Point (VRP)	COG						
Project Name	Morven Grid Connection 1 Route Environmental Survey			Deployment Location	Starboard A-Frame Mid	x	9.31	y	-14.81	z	5.97
Primary Positioning System	C-Nav 3050 (A)			Actual Coordinates derived from	Beacon						
Geodetic Reference System	Datum	WGS 84 (18) to ED50	Ellipsoid	International 1924	Projection	UTM zone 30N (3°W)			Vertical / Tidal Datum	MSL	

Date	Time (UTC)	Fix number	Stn No	Penetration %	Sample Retention	Retention	Observed Seafloor Depth (m)	Actual coordinates		Target coordinates		Offset from target				Surveyor	Remarks
								Easting	Northing	Easting	Northing	dE	dN	Range	Bearing

APPENDIX A FIELD SAMPLING LOGS

Gardline — Seafloor Sampling Positioning Summary

Job No	59294			Vessel	MV *Ocean Reliance*						
Client	Morven Offshore Wind Limited			Vessel Reference Point (VRP)	COG						
Project Name	Morven Grid Connection 1 Route Environmental Survey			Deployment Location	Starboard A-Frame Mid	x	9.31	y	-14.81	z	5.97
Primary Positioning System	C-Nav 3050 (A)			Actual Coordinates derived from	Beacon						
Geodetic Reference System	Datum	WGS 84 (18) to ED50	Ellipsoid	International 1924	Projection	UTM zone 30N (3°W)		Vertical / Tidal Datum	MSL		

Date	Time (UTC)	Fix number	Stn No	Penetration %	Sample Retention	Retention	Observed Seafloor Depth (m)	Actual coordinates		Target coordinates		Offset from target				Surveyor	Remarks
								Easting	Northing	Easting	Northing	dE	dN	Range	Bearing

APPENDIX A FIELD SAMPLING LOGS

Gardline — Seafloor Sampling Positioning Summary

Job No	59294			Vessel	MV *Ocean Reliance*						
Client	Morven Offshore Wind Limited			Vessel Reference Point (VRP)	COG						
Project Name	Morven Grid Connection 1 Route Environmental Survey			Deployment Location	Starboard A-Frame Mid	x	9.31	y	-14.81	z	5.97
Primary Positioning System	C-Nav 3050 (A)			Actual Coordinates derived from	Beacon						
Geodetic Reference System	Datum	WGS 84 (18) to ED50	Ellipsoid	International 1924	Projection	UTM zone 30N (3°W)			Vertical / Tidal Datum	MSL	

Date	Time (UTC)	Fix number	Stn No	Penetration %	Sample Retention	Retention	Observed Seafloor Depth (m)	Actual coordinates		Target coordinates		Offset from target				Surveyor	Remarks
								Easting	Northing	Easting	Northing	dE	dN	Range	Bearing

APPENDIX A FIELD SAMPLING LOGS

Gardline — Seafloor Sampling Positioning Summary

Job No	59294			Vessel	MV *Ocean Reliance*						
Client	Morven Offshore Wind Limited			Vessel Reference Point (VRP)	COG						
Project Name	Morven Grid Connection 1 Route Environmental Survey			Deployment Location	Starboard A-Frame Mid	x	9.31	y	-14.81	z	5.97
Primary Positioning System	C-Nav 3050 (A)			Actual Coordinates derived from	Beacon						
Geodetic Reference System	Datum	WGS 84 (18) to ED50	Ellipsoid	International 1924	Projection	UTM zone 30N (3°W)		Vertical / Tidal Datum	MSL		

Date	Time (UTC)	Fix number	Stn No	Penetration %	Sample Retention	Retention	Observed Seafloor Depth (m)	Actual coordinates		Target coordinates		Offset from target				Surveyor	Remarks
								Easting	Northing	Easting	Northing	dE	dN	Range	Bearing

APPENDIX A FIELD SAMPLING LOGS

Gardline — Seafloor Sampling Positioning Summary

Job No	59294			Vessel	MV *Ocean Reliance*						
Client	Morven Offshore Wind Limited			Vessel Reference Point (VRP)	COG						
Project Name	Morven Grid Connection 1 Route Environmental Survey			Deployment Location	Starboard A-Frame Mid	x	9.31	y	-14.81	z	5.97
Primary Positioning System	C-Nav 3050 (A)			Actual Coordinates derived from	Beacon						
Geodetic Reference System	Datum	WGS 84 (18) to ED50	Ellipsoid	International 1924	Projection	UTM zone 30N (3°W)		Vertical / Tidal Datum	MSL		

Date	Time (UTC)	Fix number	Stn No	Penetration %	Sample Retention	Retention	Observed Seafloor Depth (m)	Actual coordinates		Target coordinates		Offset from target				Surveyor	Remarks
								Easting	Northing	Easting	Northing	dE	dN	Range	Bearing

APPENDIX A FIELD SAMPLING LOGS

Gardline — Seafloor Sampling Positioning Summary

Job No	59294			Vessel	MV *Ocean Reliance*						
Client	Morven Offshore Wind Limited			Vessel Reference Point (VRP)	COG						
Project Name	Morven Grid Connection 1 Route Environmental Survey			Deployment Location	Starboard A-Frame Mid	x	9.31	y	-14.81	z	5.97
Primary Positioning System	C-Nav 3050 (A)			Actual Coordinates derived from	Beacon						
Geodetic Reference System	Datum	WGS 84 (18) to ED50	Ellipsoid	International 1924	Projection	UTM zone 30N (3°W)		Vertical / Tidal Datum	MSL		

Date	Time (UTC)	Fix number	Stn No	Penetration %	Sample Retention	Retention	Observed Seafloor Depth (m)	Actual coordinates		Target coordinates		Offset from target				Surveyor	Remarks
								Easting	Northing	Easting	Northing	dE	dN	Range	Bearing

APPENDIX A FIELD SAMPLING LOGS

Gardline — Seafloor Sampling Positioning Summary

Job No	59294			Vessel	MV *Ocean Reliance*						
Client	Morven Offshore Wind Limited			Vessel Reference Point (VRP)	COG						
Project Name	Morven Grid Connection 1 Route Environmental Survey			Deployment Location	Starboard A-Frame Mid	x	9.31	y	-14.81	z	5.97
Primary Positioning System	C-Nav 3050 (A)			Actual Coordinates derived from	Beacon						
Geodetic Reference System	Datum	WGS 84 (18) to ED50	Ellipsoid	International 1924	Projection	UTM zone 30N (3°W)			Vertical / Tidal Datum	MSL	

Date	Time (UTC)	Fix number	Stn No	Penetration %	Sample Retention	Retention	Observed Seafloor Depth (m)	Actual coordinates		Target coordinates		Offset from target				Surveyor	Remarks
								Easting	Northing	Easting	Northing	dE	dN	Range	Bearing

APPENDIX A FIELD SAMPLING LOGS

Gardline — Seafloor Sampling Positioning Summary

Job No	59294			Vessel	MV *Ocean Reliance*						
Client	Morven Offshore Wind Limited			Vessel Reference Point (VRP)	COG						
Project Name	Morven Grid Connection 1 Route Environmental Survey			Deployment Location	Starboard A-Frame Mid	x	9.31	y	-14.81	z	5.97
Primary Positioning System	C-Nav 3050 (A)			Actual Coordinates derived from	Beacon						
Geodetic Reference System	Datum	WGS 84 (18) to ED50	Ellipsoid	International 1924	Projection	UTM zone 30N (3°W)			Vertical / Tidal Datum	MSL	

Date	Time (UTC)	Fix number	Stn No	Penetration %	Sample Retention	Retention	Observed Seafloor Depth (m)	Actual coordinates		Target coordinates		Offset from target				Surveyor	Remarks
								Easting	Northing	Easting	Northing	dE	dN	Range	Bearing

APPENDIX A FIELD SAMPLING LOGS

Gardline

Seafloor Sampling Positioning Summary

Job No	59294					Vessel	MV *Ocean Reliance*							
Client	Morven Offshore Wind Limited					Vessel Reference Point (VRP)	COG							
Project Name	Morven Grid Connection 1 Route Environmental Survey					Deployment Location	Starboard A-Frame Mid	x	9.31	y	-14.81	z	5.97	
Primary Positioning System	C-Nav 3050 (A)					Actual Coordinates derived from	Deployment Location							
Geodetic Reference System	Datum	WGS 84 (18) to ED50		Ellipsoid	International 1924		Projection	UTM Zone 30N (3°W)			Vertical / Tidal Datum		LAT	

Date	Time (UTC)	Fix number	Stn No	Penetration %	Sample Retention	Retention	Observed Seafloor Depth (m)	Actual coordinates		Target coordinates		Offset from target				Surveyor	Remarks
								Easting	Northing	Easting	Northing	dE	dN	Range	Bearing

APPENDIX A FIELD SAMPLING LOGS

Seafloor Sampling Positioning Summary

Job No	59294			Vessel	MV *Ocean Reliance*					
Client	Morven Offshore Wind Limited			Vessel Reference Point (VRP)	COG					
Project Name	Morven Grid Connection 1 Route Environmental Survey			Deployment Location	Starboard A-Frame Mid	x	9.31	y	-14.81	z	5.97
Primary Positioning System	C-Nav 3050 (A)			Actual Coordinates derived from	Deployment Location						
Geodetic Reference System	Datum	WGS 84 (18) to ED50	Ellipsoid	International 1924	Projection	UTM Zone 30N (3°W)		Vertical / Tidal Datum	LAT		

Date	Time (UTC)	Fix number	Stn No	Penetration %	Sample Retention	Retention	Observed Seafloor Depth (m)	Actual coordinates		Target coordinates		Offset from target				Surveyor	Remarks
								Easting	Northing	Easting	Northing	dE	dN	Range	Bearing

APPENDIX B METHODS

APPENDIX B METHODS

B.1 Seabed Imagery Acquisition

Environmental seabed images were taken by means of a digital stills shallow water camera system with a dedicated strobe and video lamp, mounted within a stainless-steel frame. Video footage was also acquired throughout transects and target investigations using a HD video camera. A USBL positioning beacon was attached to the camera frame.

Footage was viewed in real time via an umbilical, assisting in the control of the digital stills camera. This allowed for shot selection to capture sediment changes or features at the seafloor.

During acquisition, a minimum of 35 seabed photographs and 14 minutes of footage were collected at each station or transect at appropriate. The images were captured remotely using the surface control unit.

A total of 2699 photos were taken using the stills camera system across 56 stations and 3 transects. A selection of seabed photographs is presented in Appendix C, whilst environmental deck and positioning logs are contained in Appendix A.

B.2 Seabed Sampling

Benthic samples were recovered using a stainless-steel, 0.1m^2 Day grab which had been modified in-house. Low-slung pad feet when in contact with the seabed trigger the instrument. On recovery (once triggered) the weight of the instrument is transferred along the warp wires, closing the jaws of the grab. The grab carried extra weights to aid penetration on recovery and an extended bucket lip to reduce sediment washout. Storm feet and elastic straps were used to reduce the likelihood of the instrument pre-triggering in the water column during deployment.

The vessel offset of grab deployment was used to represent the position of the sampler.

Grab sampling operational procedures were as follows:

The Day grab was thoroughly washed using pentane prior to deployment at every station to prevent hydrocarbon cross contamination. Additionally, bleach was used prior to the acquisition of eDNA samples to prevent the cross-contamination of environmental DNA. A length of 10mm, dry-core, galvanised-steel cable was used to lower the Day grab to the seabed. Positional fixes were taken for each grab sample immediately following the grab reaching the sea floor. The precise time that the grab reached the seabed was determined by observations of the tension on the winch cable.

On recovery of a sample, the grab would first be examined for acceptability following strict quality assurance criteria. In the following cases, a grab sample would be rejected and the instrument returned to the pre-deployment position:

1. Jammed sample closure due to entrapment of a large stone, shell or other objects allowing surface sediment washout.
2. Accidental premature opening of sampler on recovery, causing possible surface washout.
3. Half sample obtained where the grab had not struck a flat area of bottom, or not hit true, causing a side or half bite of sediment.
4. Disruption of the sample by obvious shaking or contamination (these can occur when a sample is badly handled or if the grab strikes the side of the vessel during operations).

APPENDIX B METHODS

5. The sample represents less than 40% of the grab's total capacity (*i.e.* less than 6 litres) or totally fills the grab.
6. Sample was acquired more than 20m from the target, as determined by the onboard surveyor.
7. The presence of exopolymeric substances, mucus coagulants and/or fauna that generate them *i.e.* Myxinidae.

Three or four grab deployments were undertaken at each station depending upon requirements for sample collection (see tables below for sampling requirements). Sediment samples deemed acceptable were photographed and described.

Surficial (<2cm depth) sediments were taken directly from the Day grab for physico-chemical analysis. All containers were thoroughly washed with appropriate solvents and labelled externally prior to use to remove any organic contaminants. Hydrocarbon samples were placed in 120ml or 1l amber glass jars with solvent cleaned aluminium foil placed between the cap and glass jar, whilst the remaining samples (metals and particle size) were placed in double-lined zip-lock bags. All physico-chemical samples were stored at less than -18°C prior to analysis. Further, two surficial (<2cm depth) sub samples were acquired from each physico chemical grab as composites of five sub-samples within a single grab for fish eDNA analysis (one primary and one spare).

Sediment for bacteria and invertebrate eDNA analysis was also required at all stations. Two sub-samples were acquired from each fauna grab, for subsequent analysis (one primary and one spare). All eDNA samples were stored at less than -18°C prior to analysis.

For each faunal sample, following eDNA sub sample removal, the remaining contents of a single grab were washed into a clean plastic tray using seawater and then transferred to a 0.5mm mesh sieve. Macrofaunal samples were then placed in 1-litre polypropylene, screw-top, squat jars or 5 litre buckets and an additional internal waterproof label was added. Sieved samples were immediately fixed with a known concentration of formaldehyde solution (formalin, less than 20%). The formalin in the sample pots was subsequently diluted to a concentration of approximately 4% and stored at ambient temperature.

Table B.1 Non-Chemistry Stations in Scotland and England

Grab Number	Samples	Consumables
1	Fauna	Fauna buckets
	eDNA	1 ziplock bag
2	Spare Fauna	Fauna buckets
	Spare eDNA	1 ziplock bag
3	PSA	1 ziplock bag
	Spare PSA	1 ziplock bag

APPENDIX B METHODS

2	Spare Fauna	Fauna buckets
	Spare eDNA	1 ziplock bag
3	PSA	1 ziplock bag
	Spare PSA	1 ziplock bag
	Chemistry (MMO)	1 x 1L jar for Hydrocarbons & Organotins, PCBs, metals, TOC
	Spare Chemistry (MMO)	1 x 1L jar spare
	Fish eDNA	1 ziplock bag
4	Chemistry (standard)	1 x 120mL jar for Hydrocarbons & Organotins (top 2cm) 1 x 120mL jar for PCBs (top 2cm) 1 ziplock bag for metals, TOC (top 4 cm)
	Spare Chemistry (standard)	1 x 120mL jar as spare 1 ziplock bag as spare if possible
	Spare Fish eDNA	1 ziplock bag

B.3 Redox Procedures

The redox probe combined with oxidation reduction potential, pH and temperature was employed for data collection. The probe was pushed in the sediments to a depth of 1cm and 10cm and the results recorded in the deck field log along with details of sediment colour or odour.

B.4 Water Sampling

Niskin bottles were bleached prior to each deployment to reduce levels of DNA contamination. Niskin bottles were mounted directly to the 10mm, dry-core, galvanised-steel cable with a purse weight to maintain vertical transit and a messenger weight was affixed to allow acquisition of sample. A depth enabled USBL beacon was attached below the Niskin bottle and used to determine depth and location of the Niskin bottle prior to release of the messenger. A fix was taken immediately after release of the messenger and prior to recovery.

APPENDIX B METHODS

On recovery of a sample, the Niskin bottle would first be examined for acceptability following strict quality assurance criteria. In the following cases, a sample would be rejected and the instrument prepared for the next deployment:

1. One or both ends have not released, and the sampler has failed to trigger.
2. One or both ends have failed to seal the sample and water has leaked out
3. Disruption of the sample by obvious shaking or contamination.
4. Sample was taken from an unacceptable distance or depth as determined by the onboard surveyor.

The Niskin bottle contents were then sub sampled directly from the bottle. Two litres of water each for the primary and spare samples were filtered through a 0.8µm pore size cellulose nitrate filter using a peristatic pump (Vampire pump) to assist with the process. Samples were preserved within these filters using the supplied preservative solution and then wrapped in a plastic Ziploc bag. Samples were stored at less than -18°C prior to analysis.

B.5 Imagery Processing

Seabed photos were assessed using the Gardline developed imagery analysis program (CountEM). Both the stills and video camera were aligned, so it was possible to cross-check video against stills for protected species/habitats that may have been missed. Video frames were captured whenever the distance between fixes was more than twice the station average and if previously unseen sensitive/protected taxa were visible. This resulted in an additional nine video frames, which were analysed in CountEM. Further, where potential stony reef habitat was identified during seabed imagery analysis, video segmentation was conducted to enable an assessment of the overall stony reef resemblance and coverage.

Following quality control, data were exported into an excel file used to summarise seabed imagery observations and allow for further analysis as applicable. A reference collection of taxa ID is presented in the habitat assessment report (Gardline, 2024b).

B.6 Sample Analysis

Sediment and faunal samples were analysed by the following laboratories:

- Sediment hydrocarbon, metals, TOC, PCB, OCP and organotin analyses were carried out by SOCOTEC, Burton-on Trent, Staffordshire, UK.
- PSA, benthic macrofaunal identification and biomass determination was undertaken by Thomson Environmental Consultants Limited, Guildford, UK;
- Sediment metabarcoding was carried out by Nature Metrics Ltd, Egham, UK.

The laboratories detailed above meet quality control requirements exacted by Gardline's internal procedures (BS/EN/ISO 9001:2015; BSI, 2008).

B.7 Particle Size Analysis

Particle size analysis was carried out by Thomson Environmental Consultants Limited in accordance with NMBAQC methods for diamictons (Mason, 2016).

No dispersants were used and the sediment was not treated to remove carbonates or organic matter prior to analysis.

APPENDIX B METHODS

The results, given in Appendix E and summarised in Section 2.4.1, present particle size distributions in terms of mean phi, fraction percentages (*i.e*. gravel, sand and fines), sorting (mixture of sediment sizes) and skewness (weighting of sediment fractions above and below the mean sediment size) and kurtosis (degree of peakedness) (Folk & Ward, 1957). The sediment samples were additionally classified using the modified Folk triangle classification and the EUNIS classification. These classifications use the sand:mud ratio and the percentage of gravel (Folk, 1954; Parry, 2019).

B.8 Total Organic Carbon

An aliquot of air dried and ground sample was mixed with sulphurous acid and allowed to effervesce to remove any inorganic carbon. The digested sample was then heated until any remaining acid had evaporated and the sample had dried. The dried residue was then analysed for carbon content using an Eltra induction furnace fitted with a NDIR cell. The total quantity of carbon liberated is calculated and reported as a percentage of the original mass of sample.

B.9 Hydrocarbons

B.9.1 Extraction Procedures

MMO Methodology
Anhydrous sodium sulphate, sodium chloride and DCM was added to a portion of the as received sample and was vigorously agitated. The sample is placed in an ultrasonic bath and then centrifuged.

Total Hydrocarbon Methodology
A sub-sample of the sample was treated with methanol and DCM and mixed on a magnetic stirring plate (wet vortex extraction). The solvent extract was then chemically dried, water partitioned and then reduced. The clean-up stage utilised activated silica gel along with DCM and pentane, which removes polar organics. The samples were then subjected to a further copper clean-up stage to remove any sulphur.

A separate sub-sample was taken for analysis of moisture content by drying for 8 hours. The moisture content was later used to convert the hydrocarbon concentrations from wet weight to dry weight.

B.9.2 Analysis

MMO Methodology
The extract was then analysed by UV fluorescence screening and quantified by comparing the results against a Forties Oil calibration curve.

Total Hydrocarbon Methodology
An aliquot of the extract was then taken and analysed for THC and individual n-alkanes by large volume injection GC-FID and one taken to be analysed for PAH, dibenzothiophene and alkylated isomer concentrations by GC-MS selected ion monitoring as specified in DTI (1992).

Appropriate column and GC conditions were used to provide sufficient chromatographic separation of all analytes and required sensitivity. GC chromatograms are presented in Appendix G.

APPENDIX B METHODS

Concentrations of THC from the extract analysed by GC-FID were quantified. The concentration in the sample was then calculated against the squalene surrogate. The chromatographically resolved individual n-alkane peaks nC_{10}-nC_{37} were quantified using the florida mix standard.

Concentrations of PAH from the extract analysed by GC-MS were determined by referencing individual quantified mass peak areas for each target compound to the appropriate internal standard quantified mass peak area and the relative response factor calculated from the applicable CCC standard.

The analysis detection limits were 1ng g^{-1} for PAHs, 1ng g^{-1} for individual n-alkanes and 100ng g^{-1} for THC.

B.9.3 PCBs

An air-dried and sieved sample was spiked with 13C labelled internal standards, ultrasonically solvent extracted and concentrated under nitrogen. A clean-up stage was employed to remove contaminants that may have interfered with the analysis. The sample extract was analysed by gas chromatography coupled to a triple quadrupole mass spectrometer (GC-MS-MS). Quantification was performed by comparison with a solution containing each of the targeted compounds, normalised to the 13C labelled internal standards.

B.9.4 Organotins

A portion of as received sample was digested with hydrochloric acid and methanol before extraction into toluene. The extract was then derivatised using sodium tetraethylborate (STEB) before concentration and a copper/silica clean-up stage. The extract was analysed by GC-MS and quantified by comparing the results against calibration curve for each of the target analytes.

B.10 Metals

B.10.1 Extractions for ICP-OES and ICP-MS Determination

Aqua Regia
Approximately 1g of air-dried and ground (particle size <118µm) sediment was digested for1 hour with aqua regia. Once cooled the sample was then analysed by inductively coupled plasma- optical emission spectrometry (ICP-OES) or inductively coupled plasma-mass spectrometry (ICP-MS).

Hydrofluoric Acid
A sample of air-dried and ground (particle size <212µm) sediment was digested by treatment with hydrofluoric, nitric and hydrochloric acid by microwave. The digest was cooled within the microwave and any excess hydrofluoric acid left after the digest was complexed with boric acid then reheated in the microwave. The sample was then diluted with 2% nitric acid prior to analysis by ICP-MS.

As, Cd, Cr, Cu, Hg, Ni, Pb, V and Zn were determined by ICP-MS with Ba was determined using ICP-OES. Detection limits and the spectral line emission wavelengths of the various elements analysed are presented in Table B.4.

APPENDIX B METHODS

Table B.4 ICP Detection Limits, Elemental Emission Wavelengths and Atomic Masses

Analysis	ICP-MS	ICP-OES	HF Extraction LOD (µg g^{-1})	Aqua Regia Extraction LOD (µg g^{-1})
Element	Atomic Mass Units	Elemental Wavelengths (nm)		
As	75	-	0.14	0.5
Ba	-	455.403	7.2	-
Cd	111	-	0.03	0.04
Cr	52	-	1	0.5
Cu	65	-	0.7	0.5
Hg	202	-	0.01	0.01
Ni	60	-	0.4	0.5
Pb	208	-	0.6	0.5
V	51	-	1	-
Zn	66	-	3.5	2

B.11 Quality Control

Quality control consists of running full method blanks together with one in-house reference material or certified reference material (CRM) where required and one duplicate sample per batch of twenty samples. Instrument performance is monitored by the use of instrument blanks, continuing calibration checks and independent calibration checks.

Instrument and process blank solutions are also run at regular intervals (with each batch) to monitor potential sources of contamination.

B.12 Metabarcoding

B.12.1 DNA Extraction and Sequencing

Sediment

In the laboratory, DNA was extracted from each sample for bacterial and infaunal analysis using a commercial DNA extraction kit. An extraction blank was also processed for each extraction batch. Additionally, a sample was extracted for fish DNA analysis.

DNA were amplified with PCRs using primers that target a specific region of a barcode gene. The PCR reaction was repeated several times on each sample in order to maximise the detection of a target species. A PCR blank was performed alongside each PCR reaction. PCR replicates for each sample were pooled and purified, with sequencing adaptors added to uniquely identify each DNA sequence. All purified index PCRs were pooled in equal concentrations into final libraries.

B.12.2 Bioinformatics

Sequence data were processed for quality filtering, operational taxonomic unit (OTU) clustering and taxonomic assignment. Taxonomic assignments were made for each OTU using sequence similarity searched against four reference databases appropriate for the data set. Results for all searches were combined and assignments made to the lowest possible taxonomic level where there was consistency. Unidentified or common contaminant DNA sequences (including human and livestock) were removed.

APPENDIX B METHODS

B.13 Macrofaunal Analysis

B.13.1 Sorting and Identification

In the laboratory, samples were gently washed across a 0.5mm mesh sieve to remove any sediment fines and preservative. The retained material was sorted by hand to extract all macrofauna. The organisms were identified and counted to produce a species list for each grab sample. Sample residues were checked by a second individual to provide a degree of quality control.

B.13.2 Data Set Rationalisation

The faunal data set was rationalised according to the standard Gardline (2023b) procedure, which is largely based on British Standard ISO16665:2013 (BSI, 2014) and OSPAR (2017a) guidelines. A summary of these methods follows.

Juveniles

The inclusion of juvenile organisms in data sets is a contentious issue, as is the definition of a juvenile. Only when the following conditions were satisfied was an organism recorded as a juvenile:

- Organisms that were too small or immature to be identified to species were identified to the lowest possible taxonomic level and recorded as juveniles.
- The organism was in a pre-adult life stage *e.g.* megalopa, praniza, *etc.*
- For large-bodied (>4cm) species of echinoderm and bivalve, the organism was less than 10% of the maximum body size reported in the literature.

In accordance with BSI guidelines, juveniles are recorded separately in the faunal list in Appendix J. Juveniles were included in the analysed data set at the lowest achievable taxonomic level. In the first instance, a RELATE analysis was carried out to compare the data sets with and without juveniles to determine if discussion of both sets separately is required. If the two data sets are found to be at least 95% similar, then the juveniles are included in the data set for all further multivariate analyses and discussion. Alternatively, the multivariate analyses were additionally performed following exclusion of all juvenile records to illustrate their influence. Furthermore, in accordance with OSPAR (2017a), if one or more of juvenile taxa were among the ten most dominant, statistical analysis of the faunal community should be conducted both with and without juveniles to illustrate their influence on the faunal community.

Damaged Specimens

Destructive sampling techniques and sieving may damage delicate benthic organisms. It is, therefore, commonplace for fragmented organisms to be found in faunal samples. The following conditions were applied to the recording of damaged specimens and fragments:

- Fragments that constituted a major component of an individual, that unequivocally represented the presence of an entire organism and that could be identified to species level, were recorded and included with other counts of that species.
- Fragments that constituted a significant component of an individual, that unequivocally represented the presence of an entire organism, but that could not be identified to species by virtue of their incompleteness, were recorded to the lowest possible taxonomic level.
- Fragments that did not unequivocally represent the presence of an entire organism were ignored when calculating species abundances. Recorded fragments, therefore, represent discrete observations of individuals that were present at the time of sampling and were included in the analysed data set.

APPENDIX B METHODS

Treatment of Specific Groups of Organisms

Gardline defines macrofauna as organisms that are normally larger that the mesh size of the sieve used to separate them from the sediment (Gardline, 2023b). Meiofaunal organisms, such as Ostracoda and Copepoda, which would not be consistently sampled, were not recorded.

Planktonic organisms, such as Chaetognatha and Mysidacea were not recorded. The presence of nektonic species, such as fish and Cephalopoda, was recorded, but they were not enumerated.

With the exception of discrete sea pen (Pennatuloidea) colonies, only solitary tunicates and cnidarians were enumerated and included in statistical analyses. Colonial tunicates and cnidarians were identified but not enumerated.

The testate amoeba *Astrorhiza* sp. was the only foram routinely enumerated.

Where Gnathiidae were recorded, those individuals not identified to species level were grouped as a single indeterminate Gnathiidae entry.

In accordance with our in-house guidelines the following organisms were not identified to species, but were enumerated and included in the data set for analyses at a higher taxonomic level:

- Nemertea – identified to phylum
- Platyhelminthes – identified to phylum
- Phoronida – identified to genus
- Hemichordata – identified to phylum.

B.14 Biomass

Following identification of the samples, each individual taxa (where required) were biomassed by wet weight. Biomasses were weighted in grams recorded up to 4dp.

B.15 Statistical Analyses

B.15.1 Univariate Macrofauna Indices

Univariate community analyses were undertaken using the PRIMER (version 7) software package. Univariate indices seek, by means of a single number, to summarise information about some aspect of community structure. The two aspects of community structure contributing to the concept of diversity are species richness (a measure related to the total number of species present) and evenness (a measure relating to the pattern of distribution of individuals among the species present).

Diversity indices, as typified by the Shannon-Wiener index, are considered to be a relatively insensitive measure of anthropogenic disturbance. However, benthic ecologists have been able to demonstrate a clear inverse relationship between diversity and total oil concentrations in sediments (Davies *et al.*, 1984). They are therefore of some practical use for making comparisons between stations and sites.

The following indices were calculated and are presented in the report:

APPENDIX B METHODS

Margalef's Richness Index

Species richness is sometimes given simply as the number of species in a sample but this is of course very dependent upon sample size. Alternatively, Margalef's index (*d*) may be used as this takes account of the number of species present for a given number of individuals.

Shannon-Wiener Diversity Index

This is a widely used measure of diversity providing an integrated index of species richness and relative abundance (Clarke & Warwick, 2006). It is basically a measure of the difficulty of predicting the identity of an individual based on overall community composition.

H' integrates the number of species and individual abundance to provide a summary value reflecting the diversity of fauna at a station. This index of diversity is influenced by both species richness (*i.e.* the number of species) and evenness (or equitability) of distribution of individuals between species.

Simpson's Dominance Index

Simpson's is a dominance index derived from the probability of picking two individuals from a community at random that are from the same species. Therefore, Simpson's dominance index values will be higher when a community is dominated by one or a few species but lower when the community is diverse.

Simpson's dominance index ranges from 0 to 1 with high values indicating high dominance and low evenness.

Pielou's Evenness

Evenness (or equitability) is a representation of how uniformly individuals are spread between species in a sample. It is a component of and calculated using, a theoretical diversity measure (in this instance Shannon-Wiener). Values range from 0 to 1 with high values indicating low dominance and high evenness.

Species Accumulation Curves

Species accumulation curves show the increasing total number of different taxa observed as samples are successively pooled. Two versions are plotted in this report; the first (plotted in blue) simply takes the samples in their label order, this is often referred to as the "species observed" (Sobs) curve. The second curve (plotted in red) is smooth as it is an averaged output based on the samples being added in random order 999 times. This is referred to as the UGE (Ugland, Gray, Ellingsen) curve after Ugland *et al.* (2003).

Species Ranking

A measure of the overall dominance pattern in the sampling area may be achieved by ranking the top species per station according to abundance, giving a rank score of ten to the most dominant species, decreasing to one for the tenth most abundant species and summing these scores for all stations to provide an overall dominance score for each species (Eleftheriou & Basford, 1989). For those species ranked in the top ten, the fidelity of the species ranking can be assessed by comparing the actual rank score with the maximum possible score (thus ten multiplied by number of stations for the top rank *etc.*) for that rank as a proportion; perfect fidelity is equal to one; values lower than 0.8 or higher than 1.2 represent erratic ranking, as in a species with a patchy distribution.

Beta Diversity

The Jaccard index of similarity (1908) calculates the change in diversity on a normalised scale from 0 to 1; with 1 indicating a high level of similarity.

Rarefaction

Rarefaction calculates the species richness for a given number of individual samples based on the construction of rarefaction curves.

APPENDIX B METHODS

B.15.2 Multivariate Analyses

In addition to univariate analyses, the data were subjected to multivariate analysis using a number of different methods available within the PRIMER package (Clarke & Warwick, 2006). By considering the full data matrix as a whole and comparing each station with every other, multivariate analyses are able to highlight subtle trends in data sets that are commonly not identified when using univariate techniques. Multivariate techniques are not restricted to use with faunal data sets and if treated appropriately may also be used to compare complex physico-chemical data sets. Multivariate analyses were computed from resemblance or similarity matrices. In the case of faunal abundance data these were constructed using the Bray-Curtis measure of similarity following transformation of the data to down-weight the influence of highly abundant or dominant species. For the purposes of this survey, a square-root transformation was utilised on the abundance data, whilst a fourth-root. Transformation was required for the biomass data. According to Clarke and Warwick (2006), square root transformation allows the intermediately abundant species to contribute to the similarity, while a fourth root takes account of the rarer species, or in this case the smaller species. Note that there is rarely any practical difference between fourth root and log transformation for cluster and ordination results of faunal data, although the former is more reliable (use presence/absence rather than log). Chemical data resemblance matrices are computed using Euclidean Distance following transformation (where necessary) and normalisation to standardise measurement scales. Additionally, DNA resemblance matrices were computed using Bray-Curtis Similarity following standardisation.

Cluster Analysis and SIMPROF

Cluster analysis groups samples according to their similarity *i.e.* samples within a group are more similar to each other than they are to samples in other groups. Clustering was by a hierarchical agglomerative method using group average sorting and the results are presented as a dendrogram. Using PRIMER v7 it is possible to perform a SIMPROF (similarity profile) test at the same time as the cluster analysis to determine whether groups of samples are statistically indistinguishable or whether they contain identifiable structure. SIMPROF is an *a priori* test designed to identify groups of samples from unstructured data sets. The test employs a permutation-based analysis to determine whether groups of samples below each successive node of a dendrogram possess identifiable internal structure. If the result of a test at a particular node is not significant there is no identifiable structure within the samples below the node and they might therefore be considered to be a uniform group. A significant result indicates that samples within a group (below a particular node in the dendrogram) contain some structure and therefore may not be considered uniform. The analysis therefore identifies groups of samples that are each highly self-similar and also that are distinguishable from each other.

Ordination Analyses using non-Metric Multidimensional Scaling

Non-metric multidimensional scaling (nMDS or MDS) is a type of ordination method which creates a 2- or 3-dimensional ‘map’ of the samples (or stations) from the similarity matrix. The configuration of the samples on the ‘map’ is a reflection of their similarity, with distances between samples being representative of their dissimilarity.

It is normal for there to be some distortion (stress) between actual similarity values (in the resemblance matrix) and distance between samples on the ordination plot; perfect solutions are very rarely achieved when dealing with complex data sets. In order to achieve the lowest possible stress PRIMER adopts an iterative approach to ordination, constructing the plot by successively refining the positions of samples until the lowest stress is achieved. In reality the lowest possible stress is not always achieved since data points may become trapped in local minima. It is therefore necessary to re-run the analyses multiple times to ensure that the lowest achievable stress is found. The ordination analysis results reported were the product of 999 restarts.

APPENDIX B METHODS

The scale and orientation of MDS ordinations are arbitrary so no axes are drawn on the plots. Stress values increase with sample size and usually also with increasingly severe transformation of the initial data set (due to the increasing influence of rarer species on the outcome of analyses). The stress value may be used as an indication of the usefulness of plots, with a general guide being as follows (Clarke & Warwick, 2006):

<0.05	Almost perfect representation of rank similarities
0.05 to <0.1	Good representation
0.1 to <0.2	Still useful
0.2 to <0.3	Should be treated with caution
>0.3	Little better than random points

BEST (BIOENV)

Where differences in macrofaunal community structure are found it is acceptable to attempt to link these to abiotic variations in the environment. This may be achieved using multivariate routines in the PRIMER called BVSTEP and BIOENV. In this instance BIOENV analysis has been used due to the size of the data sets.

BIOENV searches amongst a specified data matrix (normally transformed and/or untransformed data matrix) to find sub sets of variables (or species) that best 'fit' the multivariate pattern of a separately specified resemblance matrix. In other words, it identified a sub set (or sub sets) of variables within one data set that produces the most similar (highest correlation) pattern to the overall multivariate pattern of another data set. From a random starting point the analysis adds and removes variables from the initial data sets and assesses whether these improve or worsen the match to the second data set overall. Once the best match is achieved analysis is terminated. The results depend somewhat upon the starting point of the analysis and the test is therefore always run with multiple restarts to ensure that the best fit is found.

SIMPER

Where differences between groups of samples are found, SIMPER may be used to interpret which species, or environmental variables, are principally responsible for the differences between the groups and which are most responsible for the similarities within groups. The SIMPER analysis decomposes differences between all pairs of sample, one from each identified group, into their contributions from each species or variable and ranks them in decreasing order of their contribution to overall dissimilarity.

RELATE

The RELATE test of PRIMER calculates the rank similarity of two specified data matrices, so, for instance, may be used to provide an indication of the effect of the removal of a sub set of taxa (*e.g*. juveniles) on the structure of the data set overall.

B.15.3 Spearman's Rank Correlation

Spearman's Rank Correlation co-efficient is a non-parametric correlation analysis that may be used to test for relationships between environmental variables. Significant relationships indicate that environmental variables vary similarly. Large numbers of significant correlations might suggest the presence of an environmental gradient, that in the absence of obvious natural changes in the environment (such a depth gradient), may be attributable to point source pollution or some other form of anthropogenic interference. A matrix of Spearman's rank correlation coefficients, comparing many of the environmental variables is presented in Appendix F.

B.15.4 Dixon's and Grubb's tests for Outliers

Within the data set of environmental variables, one or more values may differ considerably from the majority of the rest. To identify such values for investigation as to whether they are deviant results or indicative of a notable

APPENDIX B METHODS

trend at seabed, Dixon's Q-test for outliers may be used for data sets of 5 to 25 samples, while Grubb's test may be used for data sets containing >25 samples. Both tests assume a normal distribution.

The Dixon's Q-test is performed by taking the difference of the highest (or lowest) value and the value nearest to it and dividing this by the range of the data for that variable. The Grubb's test (also called the extreme studentised deviate) compares each value with the mean and the standard deviation for that variable.

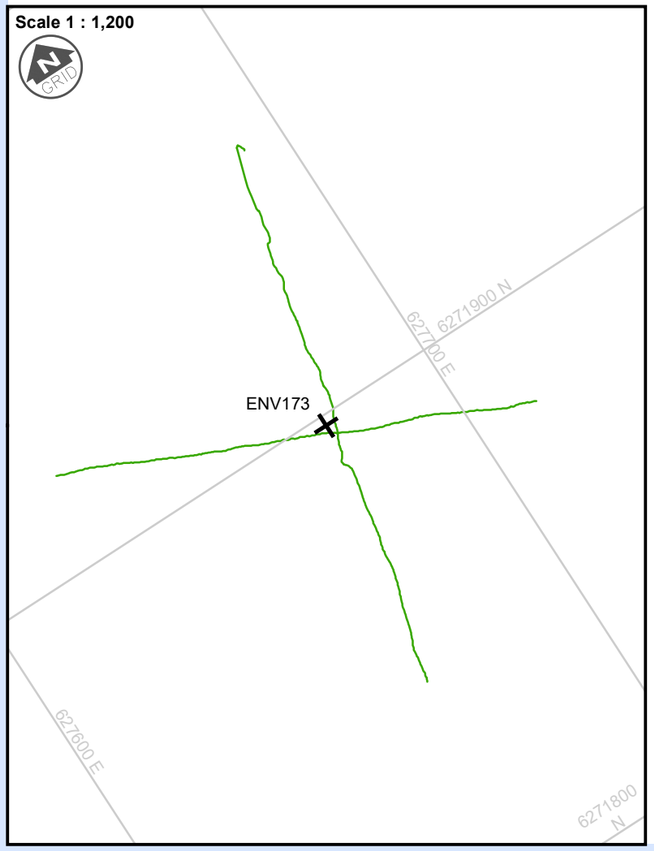
The results of the Dixon's/Grubb's test for both high and low outliers is presented in Appendix F.

B.16 EUNIS Habitat Classification

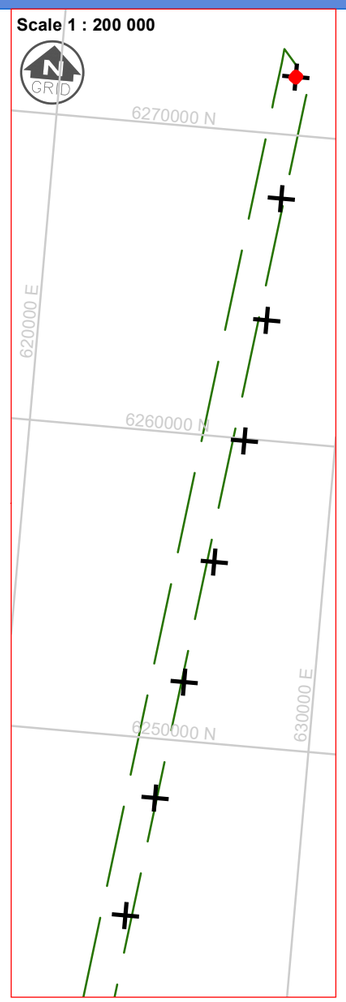
Habitat classification is used to identify different habitats and biotopes based on the biotic and abiotic features of the seabed. Habitat and biotope classifications were conducted on the available survey data, adhering to protocols within EUNIS. The system was developed between 1996 and 2001 by the EEA in collaboration with European experts. The table below gives examples of the five EUNIS levels used to describe the marine environments.

Table B.5 Example EUNIS Habitat Classification Levels

	Detail Covered (EUNIS code)
1. Environment	Marine benthic habitats (M)
2. Broad habitats	Circalittoral biogenic habitat (MC2)
3. Main habitats	Atlantic circalittoral biogenic habitat (MC22)
4. Biotope complexes	Worm reefs in the Atlantic circalittoral zone (MC221)
5. Biotopes	*Sabellaria spinulosa* on stable Atlantic circalittoral mixed sediment (MC2211)



Development of the EUNIS classification comes from both a top-down and a bottom-up approach. The first division is based on differentiating between major biological zones related to depth (littoral down to abyssal) and differentiation of substrate type *(e.g.* rock, sand, gravel). These high-level divisions can be further subdivided based on the main biogeographical regions of Europe's seas (*e.g.* Arctic, Baltic, Atlantic) with these regional splits being based on a combination of salinity and temperature. Such broad-scale differences in habitat character are readily understood by non-specialists and provide classification types that are easily mapped. However, they also have ecological relevance as they reflect major changes in habitat character upon which species distribution depends (Connor *et al.*, 2004).



Bottom-up classification differentiates between places with different species communities. Relative species composition, diversity and abundance vary from place to place and are dependent both on environmental characteristics and upon interactions between species. Surveyed sites with similar environmental characteristics, such as sediment type and depth, show certain levels of similarity in their species communities.

Cobbles with coarse sediment

Faunal Description:
Cnidaria (*Alcyonium digitatum*)

Station: ENV183
Fix: 1885 **E:** 611 559 **N:** 6 082 978 **Depth (m):** 32

Sediment Description:
Sand with cobbles, gravel and shell hash

Faunal Description:
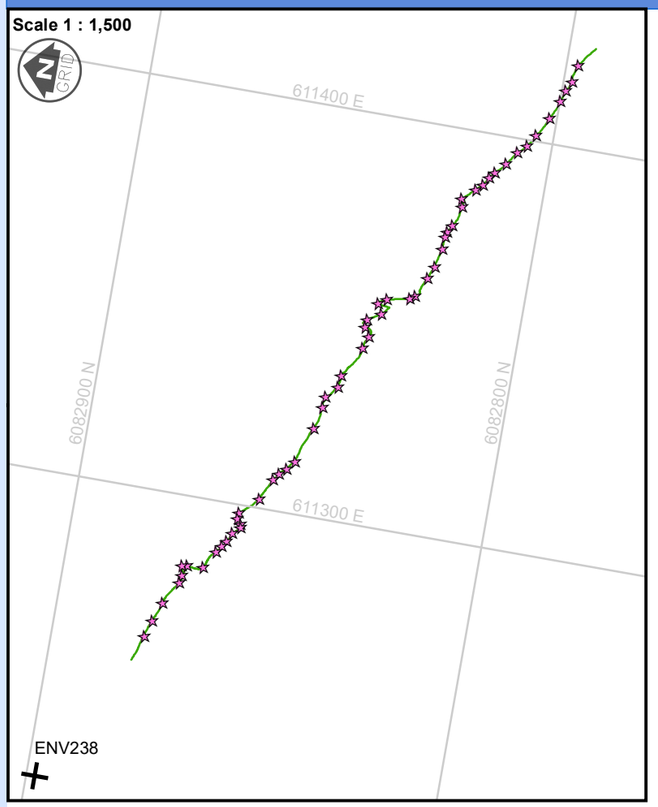
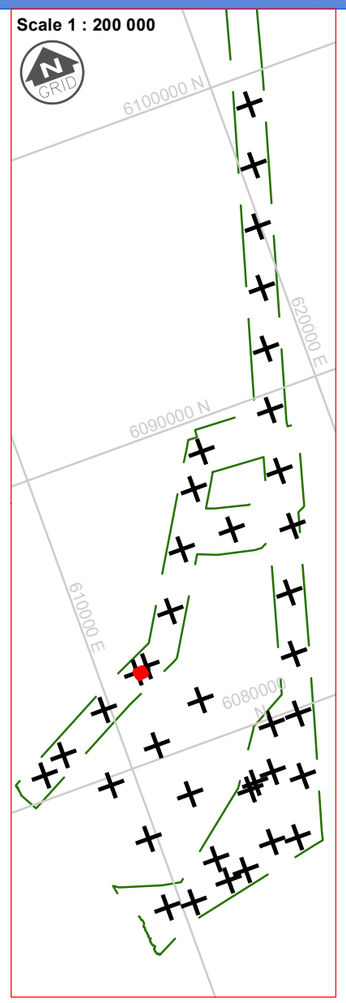
Chordata (Actinopterygii *indet.* 01)





Station: ENV183
Fix: 1893 **E:** 611 609 **N:** 6 082 977 **Depth (m):** 32

Sediment Description:
Sand with gravel and shell hash

Faunal Description:
Arthropoda (*Cancer pagurus*)

APPENDIX D BACKGROUND INFORMATION

APPENDIX D BACKGROUND INFORMATION

D.1 Sediment Characteristics

Particle size distributions of sediments in the marine environment are largely determined by hydrodynamic energy at the sediment water interface. Strong currents tend to scour the seabed thereby resuspending fine particles and any material associated with them, whilst the finest sediments predominate in areas with the least hydrodynamic energy.

The role of sediment in the transport and retention of chemical pollutants is tied to both particle size and to the amount of particulate organic carbon associated with the sediment. The chemically active fraction of sediment is usually cited as the organic component and the finest size fractions (smaller than 63µm, silt, clay). The sediment, in particular the organic carbon and finer fractions, acts as a sink for many of the persistent compounds, including metals, hydrocarbons and chlorinated compounds. Many of these persistent substances are also inherently bioaccumulative and toxic. The concentrations of many parameters are typically positively correlated with the proportion of fines found in the sediment as a result of fine particles possessing a relatively large surface area. Fine sediment particles are relatively easily resuspended by waves and currents and may be transported, along with the materials sorbed to them, over large distances, finally being deposited in areas of lower hydrodynamic energy.

Generally speaking, sands and coarser grained materials are often organically deficient. Strong currents have a tendency to resuspend fine materials and their associated organic matter. Therefore, in an environment that is not nutrient enriched due to anthropogenic discharges, both total organic matter and total organic carbon will normally be lowest at sites with coarse-grained sediment, where currents are often strongest.

Sediment particle size and organic content are also critical measurements for the categorisation of habitat type since to a large extent they control which organisms are capable of living within sediments. Most benthic infaunal organisms exhibit preferences for sediment with particular grain size characteristics. Many organisms live in tubes or burrows constructed from sediment particles; each organism's ability to do this may be limited by the range of different sized particles available. The distribution and abundance of free-living mobile organisms, *i.e.* those that do not construct tubes or burrows, are also affected by particle sizes, which influence their ability to move within the sediment. Sand grains of inappropriate sizes may be too big to move or, conversely, too small to be stable.

Feeding guilds are groupings of organisms based upon the feeding strategies they employ (United States Environmental Protection Agency or US EPA, 2008) and, as such, sediment particle size and organic content can greatly affect which species guilds may dominate in any given area. Many deposit feeding organisms, which process sediment through the alimentary tract to obtain nutrition (Gage & Tyler, 1992), are highly selective of the grain sizes that they will ingest, often preferring finer sediments that possess relatively high organic content. Conversely, resuspension of fine particulate matter may clog delicate filtering apparatus used by suspension feeders to obtain their suspended food particles from seawater (Gibson *et al.*, 2005), resulting in their exclusion from muddy sediments. Additionally, the mixtures of particle sizes determine the ease with which water and oxygen move through the sediment. An abundance of fine particles in a stable environment may lead to the formation of substrata with small interstitial spaces through which oxygen diffusion can be restricted. This may lead to anoxic conditions within the sediment, which further affects the range of species that may be present. Determination of sediment particle sizes and organic content is therefore of critical importance to the interpretation of benthic environmental survey data.

APPENDIX D BACKGROUND INFORMATION

D.2 Sediment Hydrocarbons

The principal sources of hydrocarbons in the marine environment are anthropogenic (McDougall, 2000). However, contamination of the marine environment with crude oils is not a recent phenomenon, nor solely attributable to anthropogenic activities (Douglas *et al.*, 1981). Three general processes can add hydrocarbons to marine environments: biosynthetic, geochemical and anthropogenic (McDougall, 2000).

Oil is a complex mixture of hydrocarbons and other organic compounds. Hydrocarbons are the principal component of oil, usually contributing >75% of the constituents (Laflamme & Hites, 1978). Petroleum hydrocarbons can be divided into the following broad classes according to their structure: saturates (alkanes, isoalkanes and cycloalkanes), olefins (alkenes), aromatics (benzene, toluene, ethylbenzene and xylenes, or BTEX and polycyclic aromatic hydrocarbons), asphaltenes, polar compounds and resins (Leahy & Colwell, 1990; Wang & Fingas, 2005).

Due to the complex and variable composition of oil in marine sediments, quantification of total hydrocarbons, groups of hydrocarbons and individual hydrocarbons is required to allow identification of the source of oil within the sediments, be it anthropogenic, biogenic or geochemical. The DECC guidelines (DTI, 1992) call for the following analyses to be conducted for environmental surveys (including baseline surveys): THC concentration, UCM concentration, individual and total n-alkane concentrations, pristane and phytane concentrations; individual and total 2-6 ring PAH concentrations and those of their respective alkyl derivatives.

Total Hydrocarbon Concentration

THC concentration gives an indication of the total hydrocarbon present within a sediment sample; it does not give an indication of the source of contamination. The definition of THC is wholly dependent on the analytical process utilised to quantify it. In this case, THC is equivalent to total n-alkane (nC_{10} to nC_{37}), pristane, phytane, UCM and total PAH (all PAHs including alkylated derivatives) concentrations.

Unresolved Complex Mixture

The UCM consists of a large variety of branched alicyclic hydrocarbons, which are not resolved by conventional capillary GC columns and appear as a 'hump' in GC chromatograms (Bouloubassi *et al.*, 2001). These compounds remain after substantial weathering and biodegradation of petrogenic inputs has taken place, with the 'hump' becoming a more predominant feature as resolvable n-alkanes are selectively transformed by weathering. Abundant UCM is ascribed to either degraded or weathered oil residues and therefore its occurrence in environmental samples is an indicator of oil pollution (Bouloubassi *et al.*, 2001). Notably, a UCM between nC_{20} and nC_{34}, centred on nC_{29} is typical of North Sea sediments and is generally considered as 'North Sea Background'.

N-alkanes

Alkanes are the simplest aliphatic compounds, containing only carbon and hydrogen held together by single bonds and not containing a ring; they have the general formula C_nH_{2n+2} (Lyons & Plisga, 2005). The n-alkanes are continuous, straight chain alkanes, while branched-chain alkanes are known as isoalkanes or isoprenoids (Lyons & Plisga, 2005). The only isoprenoids quantified in this survey are pristane and phytane, which are isomers of nC_{18} and nC_{19}. These compounds are substantially less susceptible to weathering than their straight chain equivalents and are therefore of use when investigating the degree of weathering of a sample (Tran *et al.*, 1995).

Although generally less harmful to many living organisms than aromatic hydrocarbons, analysis of the aliphatic component (n-alkanes, pristane and phytane) can still provide valuable information to aid in the determination

APPENDIX D BACKGROUND INFORMATION

of hydrocarbon sources (Tran *et al.*, 1995). N-alkanes can be derived from a variety of origins, both anthropogenic and natural; it is therefore necessary to distinguish which of these are present, or indeed predominate, in a given environment (Tran *et al.*, 1995). There is a wide range of methods available for this purpose, but those undertaken in this report include: quantification of individual n-alkane concentrations, interpretation of GC chromatograms, the CPI (Farrington & Tripp, 1977) and the pristane:phytane ratio (Berthou & Friocourt, 1981).

Polycyclic Aromatic Hydrocarbons

PAHs and their alkyl derivatives are almost ubiquitous in marine environments (Laflamme & Hites, 1978). Natural sources of PAHs include forest fires (Youngblood & Blumer, 1975), synthesis by plants (Neff, 1979) and oil seeps (Page *et al.*, 1998). However, the largest sources of PAHs are associated with anthropogenic activities, particularly fossil fuel combustion (Neff, 2004; Laflamme & Hites, 1978). Pyrogenic PAHs may be transported long distances through the atmosphere before finally being deposited. Even after deposition, PAHs may undergo further transport, *e.g.* in urban runoff and rivers, before ultimately being deposited in marine sediments, where they sorb to organic matter and sediment particles.

Concentrations of PAHs in marine sediments vary by many orders of magnitude, ranging from less than 1ng g^{-1} in deep-water oceanic sediments up to a few mg g^{-1} in highly contaminated harbours and coastal sediments (Neff, 2004). In enclosed waters subjected to oil exploration and production activity, PAH concentrations tend to be somewhat higher than in the open ocean. Generally, the greatest PAH concentrations are found in coastal sediments. Barring the presence of point sources of hydrocarbon contamination, total PAH concentrations in marine sediments normally decrease with distance from major human population centres (Larsen *et al.*, 1986).

The occurrence and concentration of PAHs in the environment is of concern since many possess mutagenic, carcinogenic and toxic properties (McDougall, 2000; Neff, 2004). Many PAHs are readily bioaccumulated through the food web and in particular higher weight aromatics are persistent. The rate at which PAHs degrade is affected by many factors; in the marine environment photooxidation and biodegradation are considered to be the two most important processes of degradation (Neff, 2004). Therefore, PAHs are likely to be most persistent in cold, high latitude deep-waters where sediments receive little or no light. ESGOSS (1994) estimate the half-lives of 2-ring aromatics to be generally less than 100 days whilst heavier weight 5- and 6-ring aromatics may possess half lives in excess of 10,000 days.

Although found in most marine sediments, petrogenic aromatics are normally less abundant than the pyrogenic, HMW aromatics (Bence *et al.*, 1996). Elevated concentrations of LMW, more volatile, 2 and 3 ring PAHs may often be related to the presence of point sources of hydrocarbon input, including oil spills, natural seeps, drilling activity and produced water outfalls (Neff, 2004). A major source of NPD PAHs is the use of oil-based muds during drilling operations and the subsequent discharge of these cuttings on the seabed (Breuer *et al.*, 2004). Pyrogenic PAHs tend to be more widespread, but generally in relatively low concentrations.

The concentrations at which individual PAHs produce toxic effects vary widely (Long *et al.*, 1995) and are dependent on their type and bioavailability. Values for the toxicity of individual aromatics may be misleading since individual PAHs are rarely found in isolation. The best estimates of the potential toxicity of PAHs in marine sediments are ERL and ERM concentrations for total LMW, total HMW and total PAHs (Neff, 2004). Long *et al.* (1995) gives ERL concentrations for LMW and HMW PAHs of 0.55 and 1.70µg g^{-1}, respectively. ERM concentrations are 3.16 and 9.60µg g^{-1} for LMW and HMW PAHs, respectively. The ERL and ERM concentrations for total PAH concentration in sediments are 4.022 and 44.792µg g^{-1}, respectively. These concentrations are not actual thresholds of toxicity but delineate concentration ranges with associated probabilities of toxicity. The ERL is the tenth percentile in the PAH effects data provided by Long *et al.* (1995),

APPENDIX D BACKGROUND INFORMATION

while the ERM is the median, or 50th percentile. Concentrations below the ERL concentration therefore represent a range in which effects would rarely be observed; concentrations equal to or above the ERL concentration, but below the ERM concentration, represent a range in which effects would occasionally occur and concentrations equalling or exceeding the ERM concentration represent a range within which effects could frequently be expected.

The US EPA identified 16 priority low and higher molecular weight PAHs. Nine of these were selected by OSPAR as the focus for their studies and are the 4 to 6 ring compounds of particular importance due to their toxic nature even at very low concentrations. OSPAR CEMP EAC benchmark concentrations (OSPAR, 2009c) have been developed for the nine OSPAR priority PAHs plus naphthalene and dibenzothiophene.

Information on the source of PAHs in sediments may be obtained from a study of the alkyl homologues (*e.g.* methyl, ethyl *etc.* substitution) and parent compound distributions and concentrations. Sediments contaminated with petrogenic material normally contain a predominance of alkylated PAHs, particularly within the LMW range, whereas pyrogenic PAHs comprise mostly HMW unalkylated parent compounds.

D.3 Sediment Metal Concentrations

Metals are generally persistent and at elevated concentrations most are toxic to varying degrees. Many metals such as Cr, Cu and Zn are readily bioaccumulated meaning that they are absorbed and stored in organisms over time leading to potential high concentrations capable of causing lethal and sub-lethal toxic effects in benthic organisms even when found in apparently low concentrations in sediment. Metal concentrations in uncontaminated marine sediments generally exceed those found in overlying seawater by three to five orders of magnitude (Bryan & Langston, 1992), since the buffering effects of saline water cause many metals to be rapidly precipitated. Furthermore, dissolved metals are readily scavenged from the water column by organic coatings and iron and manganese coatings found on the surface of fine sediment particles. Consequently, fresh waters that are metal enriched by terrestrial runoff tend to deposit much of their metal load in estuarine or near coastal sediments. Ecological impacts attributable to anthropogenic metal contamination in non-coastal marine environments are often somewhat limited in geographical range close to the point of their origin (Rygg, 1985).

Several metals are found in high concentrations in drilling muds and produced water. Some of these metals are added intentionally to drilling muds as metal salts or organo-metallic compounds whilst others are present as trace impurities in major mud ingredients, particularly barite and clay. Those metals most characteristic of contamination of the sediment with drilling muds or cuttings are Ba, Cr, Pb and Zn (Neff, 2005) but this may vary depending upon the specific constituents of the muds. By far the most abundant metal in most drilling muds is Ba, found in the form of barite ($BaSO_4$). In exceptional cases, fine-grained marine sediments may naturally contain in excess of 1000µg g^{-1} Ba, but this figure may be greatly enhanced by contamination of sediments with drilling muds containing up to 450mg g^{-1} barium (Neff, 2005). Due to its low solubility and the fact that it is not toxic in its sulphate form (Gerrard *et al.*, 1999), elevated barium concentrations are rarely of toxicological concern. However, monitoring sediment barium concentrations can provide information regarding the extent to which drill cuttings have been transported from their point of origin.

When considering the results of the sediment metal determinations it should be borne in mind that speciation (the particular forms, or species, of any given metal that exist in a sample), sediment granulometry and partitioning of metals between water and sediment phases all affect bioavailability and therefore toxicity. Even if a metal is present at above normal concentrations, it does not necessarily follow that the metal will produce ecologically deleterious effects, particularly if it is present in an insoluble or relatively low toxicity form. Historically, a wide range of different extraction techniques have been employed that were intended to provide an estimate

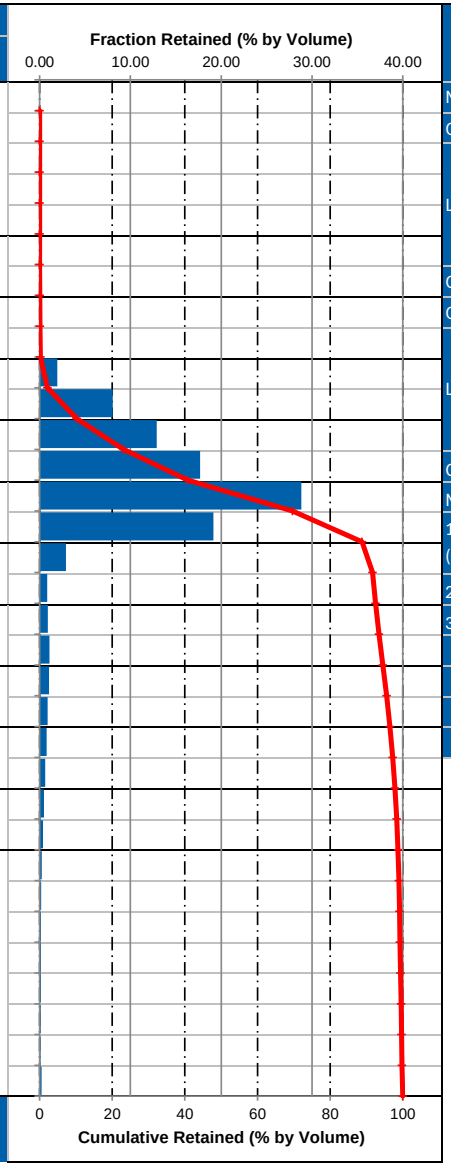
APPENDIX D BACKGROUND INFORMATION

of the concentrations of metals in marine sediments that may be available to the biota. One of the common methods of modelling metal bioavailability is extraction of oxic (surficial) sediments with weak acids (*e.g.* 1M nitric acid) since most anthropogenic metal contaminants show a much higher affinity to fine particulate matter than the coarse fraction by the presence of organic matter and clay minerals. These techniques have been shown to produce results that correlate closely with metal burdens in the tissues of benthic organisms (Luoma & Davis, 1983; Bryan & Langston, 1992). However, the extent to which a particular method of extracting metals from sediments reflects their bioavailability is still not well understood and the debate regarding which methods may be most appropriate is ongoing.

Total sediment metal concentrations have historically been the preferred measurement for offshore surveys. Whilst these provide little information regarding concentrations of metals that may be bioavailable, since they involve total dissolution of the sediment, they are however, useful for comparisons between surveys and will give an indication of whether or not sediments are contaminated. There is a growing body of data that provides broad figures for the total concentrations of many metals likely to be found in uncontaminated marine sediments (see OSPAR, 2005). Baseline figures may therefore be compared to these data to assess whether sediments in an area may have been anthropogenically contaminated prior to any works being carried out. Where elevated concentrations of metals are found, results may be compared to existing sediment metal toxicity data in order to assess whether particular metals may be exerting a toxicological effect on benthic communities (see Buchman, 2008).

D.4 Macrofaunal Analyses

The macrofaunal investigation in this survey is designed to provide a description of the benthic infauna and how it varies across the survey area. Marine benthic invertebrate communities have been shown to be sensitive to environmental change, particularly environmental degradation as a result of anthropogenic contamination (Davies *et al.*, 1984; Warwick & Clarke, 1991). Analysis of faunal data sets may therefore provide insight into any changes resulting from point source pollutants and disturbance.



D.5 Sediment Metabarcoding

In addition to traditional methods used for sediment metabarcoding in this survey sediment metabarcoding acts to increase assessments of important components of biodiversity that may be neglected due to the difficulty of taxonomic identification using conventional morphological approaches. DNA biodiversity monitoring provides additional information about the sediment biodiversity of the bacteria and fauna within the survey area. Bacteria are a useful indicator of water quality due to species diversity and ability to respond to changing environmental conditions (Lemke *et al.*, 1997).

Concentrations are expressed as ng g^{-1} dry weight

NA Not available

NC Not calculated due to concentrations below LOD

Blue cells correspond to concentrations above BC when normalised to 2.5% TOC (OSPAR, 2005)

Dark blue cells correspond to average concentrations above BAC when normalised to 2.5% TOC (OSPAR, 2005)

Green cells correspond to concentrations above the BRC maximum for SNS when normalised to 2.5% TOC (OSPAR, 2005)

Red cells correspond to concentrations above the EAC when normalised to 2.5% TOC (OSPAR, 2009a)

EXECUTIVE SUMMARY

During August and September 2024, Gardline conducted an UXO clearance and environmental survey on behalf of Morven Offshore Wind Limited along the proposed Morven Grid Connection 1 (GC1) route (hereafter; the route) from the proposed Morven offshore wind farm to landfall near Sunderland. The offshore survey was conducted onboard the motor vessel (MV) *Ocean Reliance* between 06-Aug-2024 and 21-Aug-2024, with the nearshore survey conducted onboard the MV *Titan Endeavour* between 30-Aug-2024 and 18-Sep-2024.

The aims of the environmental survey were to determine the characteristics of the seabed, benthic and pelagic communities and to identify any environmentally significant habitats.

A total of 54 stations were pre-selected along the route. This comprised 8 stations located within the northern block, mostly in Scottish waters, 13 stations in the central block and 33 stations in the southern block, located in English waters. A further 2 stations and 3 video transects were added to the nearshore survey during data acquisition. At all 59 locations, drop-down camera data were successfully acquired. Sediment sampling was conducted at 52 stations along the route, of these the required full suite, as per the benthic scoping document (Gardline, 2024), was obtained at 49 stations. All successful samples were acquired using a 0.1m^2 Day grab. Grab samples were acquired every 2 to 4km. Further, water sampling was successfully conducted at all 34 planned stations. Observed water depth varied between 11 and 93m along the route.

The visible fauna community observed along the Morven route was typically sparse with 38% of usable stills containing visible fauna.. Across the survey area, the most frequently observed taxa and/or features were burrows (present at 29 stations from the central and southern areas and in 13% of usable images), faunal turf (present at 25 stations and 10% of usable images, mainly from the southern area), *A. digitatum* (present at 33 stations from the northern and southern areas and in 8% of usable still images) and *P. phosphorea* (present at 11 stations from the central area and in 6% of usable stills).

A total of eight pairs of *Arctica islandica* siphons were observed across Stations ENV174, ENV175 and ENV178. This species is on the OSPAR (2008) list of threatened and/or declining species and habitats and is a low or limited mobility species priority marine feature (PMF) in Scottish offshore waters (NatureScot, 2020). However, this species is commonly found within this area of the North Sea. Fifteen individuals of *Glyptocephalus cynoglossus* were identified across twelve stations. This species is recorded as vulnerable on the IUCN Red List (2025). Two individuals of *Lophius piscatorius* were observed across two stations in English waters; angler fish is listed on the UK Post-2010 Biodiversity Framework (JNCC and Defra, 2012) as a priority species. Sixteen individuals of *Pleuronectes platessa* were observed across nine stations; plaice is classified as a priority species under the UK Post-2010 Biodiversity Framework (JNCC and Defra, 2012) and is on the Scottish Biodiversity List (NatureScot, 2020). A total of thirty-five individuals of the urchin *Echinus esculentus* were identified across seven stations. This species is recorded as near threatened on the IUCN Red List (2025).

Samples for particle size analysis (PSA) were collected at 49 stations along the route. Sediments were recorded as heterogeneous, with stations classified as very poorly to moderately sorted under Folk and Ward (1957). Under modified Folk (1954) most stations were classified as either muddy sand (n=26; 53%) or sandy mud (n=12; 24%), with a mean particle diameter ranging between 12 and 927µm. Across the survey area, all stations had a negligible (<5%) gravel (≥2mm) content, except for Stations ENV214 and ENV222 which had 30% and 55% gravel content, respectively. These stations were classified as muddy sandy gravel under the modified Folk (1954). All stations in the northern and central areas were dominated by sand (≥63µm and <2mm; >72%), whereas fifteen stations in the southern area were dominated (>50%) by sand and twelve were dominated (>50%) by fines (<63µm;silt and clay).

Stations along the route coincide with a potential herring nursery ground (Ellis *et al.*, 2012). Based on the results of the PSA (where acquired) only Stations ENV214 and ENV222 recorded a sufficiently high percentage of gravel (30 and 55%, respectively) to be considered sub-prime in terms of habitat sediment classification for herring spawning potential.

Stations along the route also coincided with low intensity spawning and nursery grounds for sand eel (Ellis *et al.*, 2012). Based on the results of the PSA (where acquired), Stations ENV173, ENV174, ENV179, ENV232, ENV234 and ENV235A were suitable in terms of habitat sediment preference criteria, in that they recorded <10% fines and >50% sand. These stations also met the preferred habitat sediment classification of sand under the modified Folk (1954).

A total of 576 burrows were observed across 29 stations ranging from 0.5 to 12.8cm in diameter. In addition, two species of sea pen (*Pennatula phosphorea* and *Virgularia*) were identified at 15 stations, ranging between 0.5 and 17.0cm and 0.8 and 14.3cm in height, respectively. The JNCC (2014b) clarification report states that to be considered a sea pen and burrowing megafauna communities habitat, densities of burrows and/or mounds, together with sea pens if present, should be classified as frequent or above on the SACFOR scale. Of the 29 stations where burrows were observed 23 were in a range to be considered to show some similarity to a sea pen and burrowing megafauna communities habitat (OSPAR, 2010). Of these 23 stations, 5 (Stations ENV187, ENV210 to ENV212 and ENV230) could be considered as showing the greatest similarity to a sea pen and burrowing megafauna communities habitat in that burrows encompassed the SACFOR ranges frequent to common.

Areas of cobbles and boulders were noted during analysis, as such stations were reviewed for their resemblance to a stony reef habitat based on the criteria adopted by Irving (2009). Of seventeen stations analysed for resemblance to stony reef, nine showed low resemblance to a stony reef while six showed medium resemblance.

With consideration of the PSA and imagery, the heterogenous survey was classified to Level 4 EUNIS habitat codes, with further classification where possible. Twelve stations required two classifications due to the heterogeneity of the sediments. Further all other stations were classified as follows:

- 24 stations classified as MD52: Atlantic offshore circalittoral sand, with 15 stations classified as MD521: Faunal communities in Atlantic offshore circalittoral sand
- 9 stations classified as MC521: Faunal communities Atlantic circalittoral sand
- 23 stations classified as MC621: Faunal communities in Atlantic circalittoral mud, with 21 refined to MC6216: Sea pens and burrowing megafauna in Atlantic circalittoral fine mud
- 9 stations classified as MC421: Faunal communities of Atlantic circalittoral mixed sediment
- 6 stations classified as MC121: Faunal turf communities on Atlantic circalittoral rock

GLOSSARY OF TERMS AND ABBREVIATIONS

Benthic	Relating to the seabed
Biogenic	Produced by living organisms
BSI	British Standards Institute
Cefas	Centre for Environment, Fisheries and Aquaculture Science
Clay	Sediment grains <3.9µm in diameter
CM	Central Meridian
Defra	Department for Environment, Food and Rural Affairs
eDNA	Environmental DNA
EEA	European Environment Agency
EUNIS	European Union Nature Identification System
Fines	Sediment grains <63µm in diameter (same as Mud)
FOCI	Features of Conservation Importance
GC1	Grid Connection 1
Gravel	Sediment grains ≥2mm in diameter
HD	High Definition
IUCN	International Union for Conservation of Nature
JNCC	Joint Nature and Conservation Committee
LAT	Lowest Astronomical Tide
Macrofauna	Organisms that are normally larger than the mesh size of the sieve used. In this case 0.5mm.
MBES	Multi-beam Echo Sounder
MCZ	Marine Conservation Zone
MNCR	Marine Nature Conservation Review
Mud	Sediment grains <63µm (includes Silt and Clay)
MV	Motor Vessel
NCMPA	Nature Conservation Marine Protected Area
NERC	Natural Environment Research Council
NMBAQC	National Marine Biological Association Quality Control
NSTA	North Sea Transitory Authority
OSPAR	Oslo and Paris convention
PMF	Priority Marine Features
PSA	Particle Size Analysis
SAC	Special Area of Conservation
SACFOR	JNCC (2013) density scale classification: superabundant, abundant, common, frequent, occasional and rare
Sand	Sediment grains ≥63µm and <2mm in diameter
SD	Standard Deviation
Silt	Sediment grains ≥3.9µm and <63µm in diameter
SOW	Scope of Work
SSS	Side Scan Sonar
USBL	Ultra Short Base Line
UTM	Universal Transverse Mercator
UXO	Unexploded Ordinance

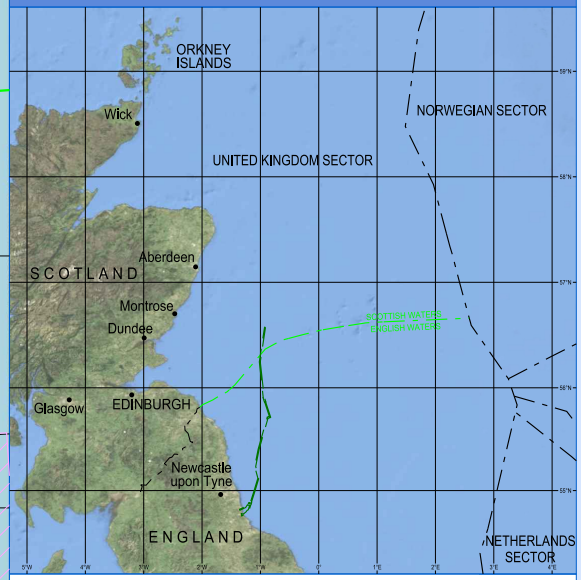
1 PROJECT SUMMARY

1.1 Scope of Work

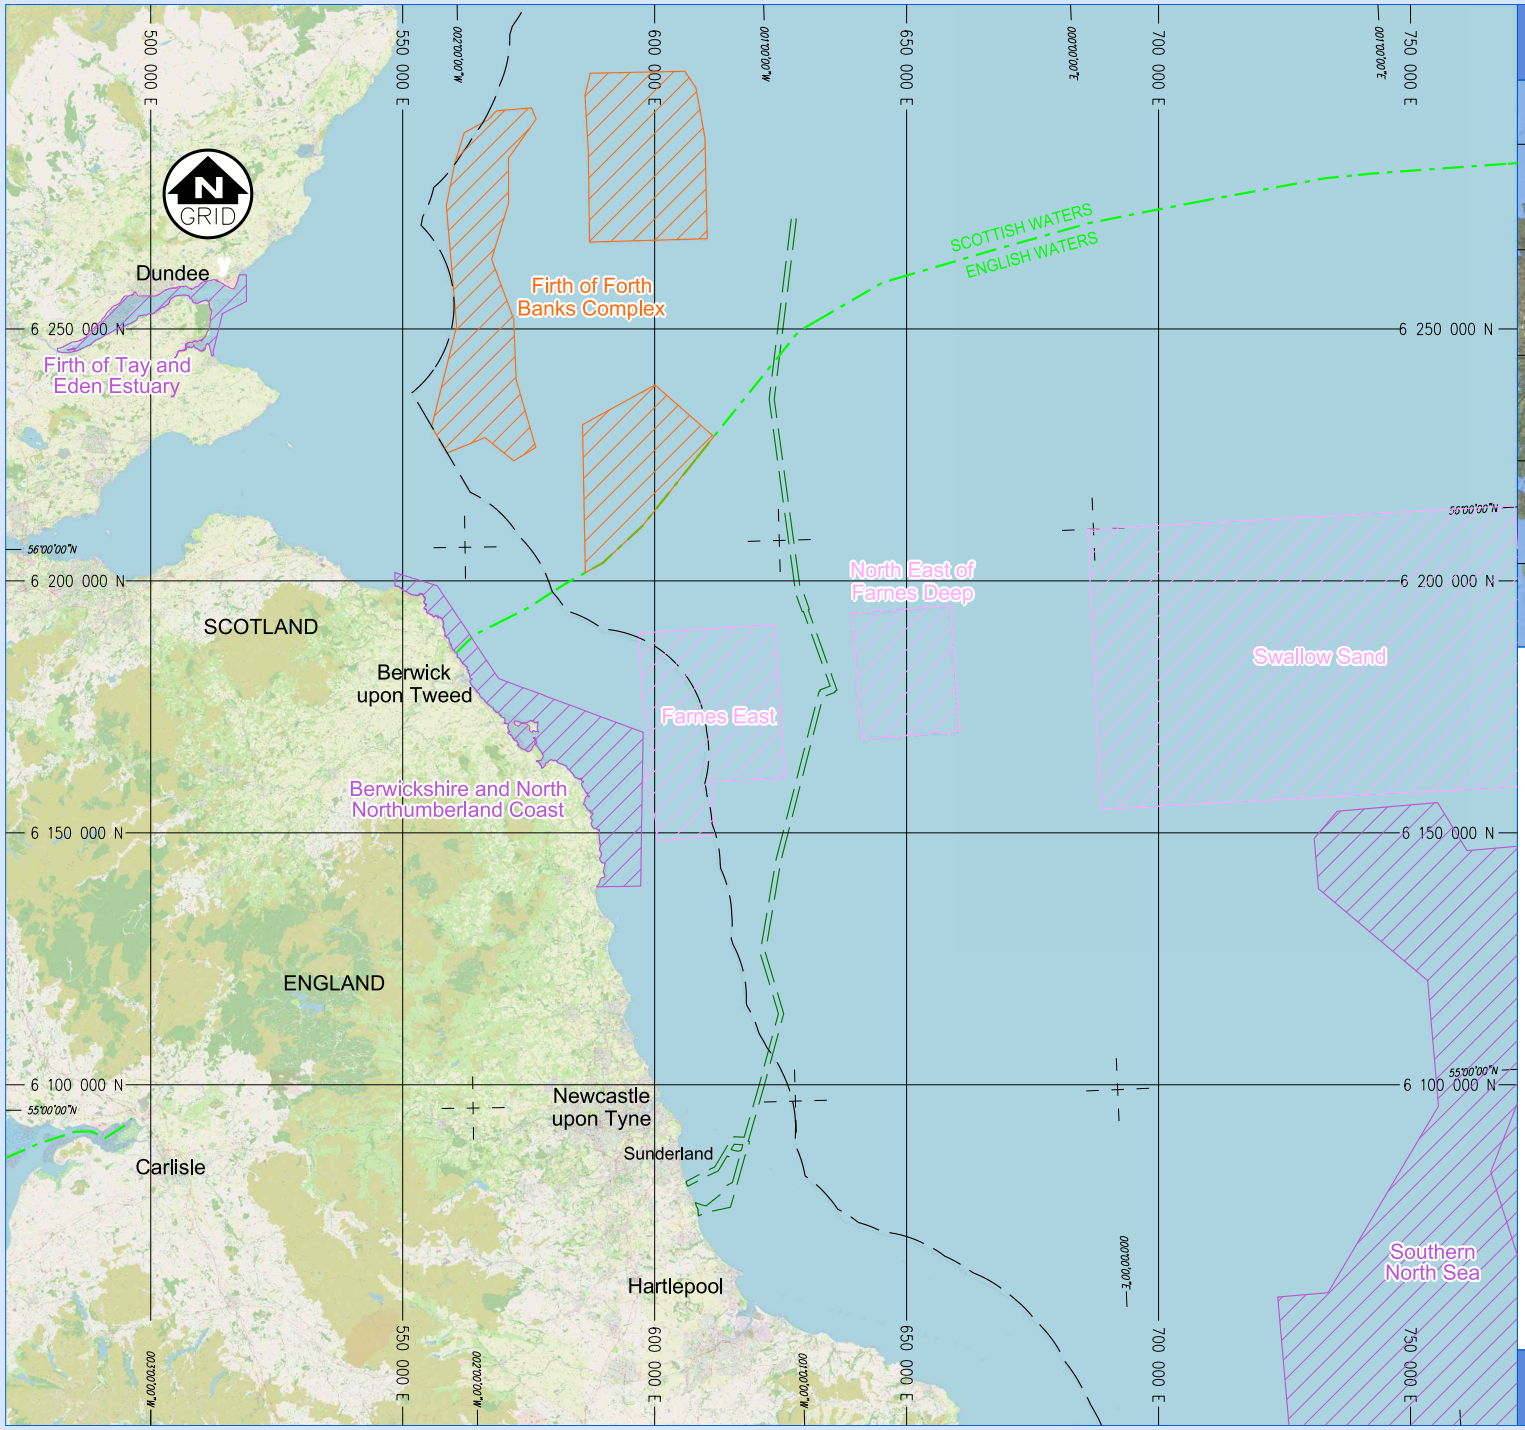
Between August and September 2024, Gardline conducted an UXO clearance and environmental survey along the proposed Morven Grid Connection 1 (GC1) route (hereafter; the route) from the proposed Morven offshore wind farm to landfall near Sunderland, on behalf of Morven Offshore Wind Limited in the central North Sea. The offshore survey was conducted onboard the motor vessel (MV) *Ocean Reliance* between 06-Aug-2024 and 21-Aug-2024 while the nearshore survey was conducted on the MV *Titan Endeavour* between 30-Aug-2024 and 18-Sep-2024.

As detailed in the scopes of work (SOW; bp, 2023; 2024), the objectives of the survey were to complete a site investigation to inform environmental impact assessment of the route (approximately 265km in length). To do this a multi-disciplinary survey was required. The objectives of the survey included:

- an initial geophysical clearance phase of the route options to complete environmental operations.
- an environmental survey to provide sediment type, benthic characterisation of habitats and species assemblages (including EUNIS biotope determination and physico-chemical analysis).
- seawater sampling using a Niskin water sampler for eDNA metabarcoding analysis to provide information on species present within the area.



To meet the aims of the habitat assessment, the presence of the following species and habitats were assessed:



- habitats, such as biogenic or rocky reefs listed under Annex I of the Habitats Directive (1992).
- habitats or species features of conservation importance (FOCI) and broadscale habitats, defined in relation to the Marine Conservation Zones (MCZ) network (Natural England and JNCC, 2010) as required under the Marine Environment Regulations (2018).
- priority habitats or species in England, listed under Section 41 of the NERC Act (2006) that were deemed to require action in the UK Biodiversity Action Plan and continue to be regarded as conservation priorities in the subsequent UK Post-2010 Biodiversity Framework (JNCC and Defra, 2012).
- species or habitats selected as priority marine features (PMFs) in Scottish offshore waters (NatureScot, 2020)
- species listed on the Scottish Biodiversity List (2020)
- species or habitats on the OSPAR (2008) list of threatened and/or declining species and habitats.
- species on the IUCN (2025) Global Red List of threatened species.

This report presents the results of the habitat assessment. The results of the environmental baseline survey (Gardline, issue pending) are presented separately.

The proposed route is plotted in Figure 1.1 alongside MCZs, nature conservation marine protected areas (NCMPAs) and special areas of conservation (SACs). All positional information in this report is referenced to International 1924 Ellipsoid, European Datum 1950. All grid coordinates are projected using UTM Projection, Grid Zone 30N, CM 3°W.

1.2 Environmental Survey Strategy

To enable clear and concise reporting, the naming convention of the stations have been shortened by the removal of the BP24MVEXP-ENV-DC/GS/WS- or MVGC1-ENV-DC/GS/WS- station identifiers. These shortened names have been used throughout this report, though the original full name has been retained in image file names and on the video overlays. The full and abbreviated names are presented in Table 1.1 along with details of station targets and reasons for their selection. An overview of the stations is presented spatially in Figure 1.2. The actual positions of the grab samples and seabed imagery, which may be offset from the intended target, are presented in the positional logs in Appendix A and plotted spatially in Appendix C.

To meet the objectives of the SOW, a total of 54 stations were pre-selected along the route. This included 8 stations spaced at approximately 4km intervals along the proposed route within the northern block, mainly in Scottish waters, 13 stations in the central block and 33 stations in the southern block, which were spaced at approximately 2km intervals along the proposed route in English waters. To ensure the proposed route was clear of archaeological artefacts and UXO for the grab sampling operations, MBES, magnetometer and SSS reconnaissance lines were run over each station target. Stations were adjusted in the field to avoid seabed hazards and other obstructions.

Stations ENV236 and ENV237 were added during the nearshore survey following gaining sampling approval from Historic England. Three additional camera-only transects were added (Stations ENV238, ENV239 and ENV240) during the nearshore survey to investigate areas of potential stony reef habitat.

Following acquisition of Station ENV235, it was determined the position of the station was outside the route boundary; therefore, sampling was reacquired as Station ENV235A, with no further analysis of the data from Station ENV235.

At all 59 stations, drop-down camera data were successfully acquired. As per the SOW (bp, 2023; 2024), all camera tracks were no more than 305m in length.

A minimum of three grab samples were proposed every 2 to 4km using a 0.1m^2 Day grab for analysis of particle size, environmental DNA (eDNA) and macrofaunal community. An additional sample was acquired at 30 stations for chemical analysis and fish eDNA. Following several unsuccessful grab sampling attempts likely attributed to coarse sediments, three stations (Stations ENV183, ENV197 and ENV198) were abandoned. Similarly, sampling was not attempted at four stations (Stations ENV182, ENV188, ENV199 and ENV219) after review of the seabed imagery due to the presence of cobbles and boulders.

Water samples for eDNA analysis was successfully acquired at all 34 planned stations.

1.3 Background Habitat Information

1.3.1 Overview

This section presents an overview of the habitats and faunal communities expected to occur (or were highlighted in the field report as potentially present) within UK and Scottish waters in the vicinity of the route.

1.3.2 Herring Spawning

The Atlantic herring (*Clupea harengus*) is a schooling, coastal pelagic species that inhabits both sides of the Atlantic Ocean (Reid *et al.*, 1999). Herring is one of the most important UK commercial marine species. It is also highly vulnerable to both fishing pressures and activities associated with the renewable industry (Gill *et al.*, 2012; Kikuchi, 2010).

Herring are reported to deposit their sticky demersal eggs on a variety of substrates ranging from boulders, rocks, small stones, coarse sand, shell fragments, macrophytes and man-made structures such as lobster pots. However, gravel is widely considered to be the preferred spawning substrate (Rogers & Stocks, 2001; Ellis *et al.*, 2012). The eggs adhere to the seabed, forming extensive egg beds. According to Reid *et al.* (1999), spawning occurs in areas of well-mixed water with reasonably strong tidal currents (1.5 to 3 knots), often on shoals and banks in relatively shallow water (approximately 15-40m deep). These high-energy environments provide aeration and reduce siltation and accumulation of metabolites (Stevenson & Scott, 2005). The negative impacts of the oil and gas industry on herring spawning grounds are primarily due to the risk of smothering from drill cuttings and disturbed sediment during installation/drilling. The negative impacts from the renewable industry on herring spawning grounds are primarily due to the risk of smothering from dredged material and disturbed sediment during installation.

1.3.3 Sand Eel Spawning

Sand eels (Ammodytidae) are small eel-like fish which swim in large shoals and are an important component of marine food webs providing food for many species of marine predators including seabirds, mammals and commercially important species such as; *Gadus morhua*, and *Melanogrammus aeglefinus* (Holland *et al.*, 2005; Jensen *et al.*, 2010). Of the five species of sand eels inhabiting the North Sea, *Ammodytes marinus* is the most abundant and comprises 90% of sand eel fishery catches (ICES, 1997).

As with other sand eel species *A. marinus* has a close association with sandy substrates into which they burrow. It is common for sand eels to prefer sandy sediments to those comprised predominately of gravel or silt (Pinto *et al.*, 1984) and they preferentially inhabit the sloping sides of sand banks (Wright *et al.*, 1998). Depth also has an influence; with sand eels being found at depths of 15 to 120m and with greater frequency at 30 to 70m (Wright *et al.*, 2000).

Spawning is suggested to occur between November and February (Coull *et al.*, 1998; Ellis *et al.*, 2010; 2012) where sand eels will spawn on the seabed and the eggs attach themselves to grains of sand (Hassel *et al.*, 2002). Sand eels hibernate in the sand during winter and bury themselves at night, so are most likely to be seen during the day between April and July. Physical disturbance to sand eel habitats may occur during operations including drilling and/or cable laying activities due to the resulting temporary sediment resuspension and increased turbidity (Bat *et al.*, 2013). These activities can therefore result in increased mortality, although it is expected that the population would recover following construction periods (Jensen *et al.*, 2010). The construction of an offshore wind farm can have a short-term positive effect on sand eel densities due to the reduction in silt and clay (van Deurs *et al.*, 2012). However, a long-term negative effect was observed in density reduction of sand eel juveniles.

1.3.4 Sea Pen and Burrowing Megafauna Communities

A sea pen and burrowing megafauna communities habitat is classified as a threatened and/or declining habitat (OSPAR, 2008). It is defined by OSPAR (2010) as plains of fine mud, extending over an area of at least 25m^2 and at water depths ranging from 15 to 200m or more. These areas are defined as being heavily bioturbated by burrowing megafauna including *Nephrops norvegicus*, *Calocaris macandreae* or *Callianassa subterranea*, with burrows and mounds typically forming a prominent feature of the sediment surface, and which may include conspicuous populations of sea pens (Pennatuloidea); typically, *Virgularia mirabilis* and *Pennatula phosphorea*. Despite its classification as a threatened and/or declining habitat (OSPAR, 2008); this habitat is widespread throughout the central North Sea, around the south and west coasts of Norway and around the north of the British Isles (OSPAR, 2010).

1.3.5 Stony Reefs

Reefs are one of the habitats of conservation significance listed under Annex I of the Habitats Directive (1992) for protection within Special Areas of Conservation. Although there is no definition of reefs in the Habitats Directive itself, European interpretation of the habitat has been discussed and agreed upon as including bedrock, stony and biogenic reefs. Stony reefs (bedrock and stony) can be extremely variable, both in structure and in the communities they support. A wide range of topographical reef forms meet the European definition of this habitat type, including; vertical rock walls, horizontal ledges, sloping or flat bed rock, broken rock, boulder fields and aggregations of cobbles (McLeod *et al.*, 2009).

Stony reefs can comprise areas of boulders or cobbles that stand proud from the seafloor and can provide a suitable substratum for the attachment of benthic communities of algae and marine fauna. Cobbles and boulders are generally considered to be greater than 64mm in diameter and a feature of a stony reef must be that it is topographically distinct from the surrounding seafloor (Irving, 2009).

Bedrock reefs occur where bedrock arises from the surrounding seabed creating a habitat that is colonised by a distinct faunal community (JNCC, 2014a).

2 RESULTS AND DISCUSSION

2.1 Geophysical Survey Overview

The survey along the route was divided into three areas: a northern, central and southern area. To provide clearance from potential UXO and other obstructions, MBES, SSS and magnetometer data were acquired over pre-selected environmental sampling locations. These data were for UXO pre-clearance only, therefore no further interpretation or analysis of the data was conducted onshore.

2.2 Seabed Imagery Observations

A selection of seabed photographs, together with descriptions and positions are presented in Appendix C, whilst a summary of all taxa identified from each station is presented in Appendix D and example images of each taxa are presented in Appendix E. Seabed imagery along the route confirmed the sediment ranged from muddy sand to coarse sand with gravel, cobbles and boulders in some areas.

Visible fauna identified to the lowest taxonomic level with confidence included:

- Annelida (*Aphrodita aculeata, Hyalinoecia tubicola, Myxicola, Oxydromus flexuosus,* Polychaeta*, Sabella pavonina,* Terebellidae)
- Arthropoda (Brachyura*, Cancer pagurus,* Caridea*,* Decapoda*, Ebalia, Goneplax rhomboides,* Inachidae*, Munida, Necora puber, Nephrops norvegicus,* Paguroidea*, Pagurus prideaux, Polybius depurator*)
- Bryozoa (*Alcyonidium diaphanum,* Flustridae)
- Chordata (Actinopterygii, *Agonus cataphractus,* Ascidiacea*, Buglossidium luteum, Callionymus lyra, Chelidonichthys cuculus, Eutrigla gurnhardus, Glyptocephalus cynoglossus, Leucoraja naevus, Limanda limanda, Lophius piscatorius, Melanogrammus aeglefinus, Myxine glutinosa, Pleuronectes platessa,* Pleuronectiformes*, Scyliorhinus canicula*)
- Cnidaria (Actiniaria*, Alcyonium digitatum, Calliactis palliata, Caryophyllia,* Ceriantharia*,* Edwardsiidae*,* Hexacorallia*, Hydractinia echinata,* Hydrozoa*, Nemertesia antennina, Nemertesia ramosa, Pennatula phosphorea, Urticina eques, Urticina, Virgularia*)
- Echinodermata (*Asterias rubens,* Asteroidea*, Astropecten irregularis, Echinus esculentus, Henricia, Hippasteria phrygiana, Luidia ciliaris, Ophiocomina nigra, Ophiothrix fragilis,* Ophiuroidea*, Stichastrella rosea*)
- Mollusca (*Aporrhais pespelecani*, *Arctica islandica* siphons, Bivalvia siphons, *Calliostoma zizyphinum, Coryphella,* Gastropoda, Nudibranchia, Pectinidae*,* Scaphopoda, Sepiida*,* Turritellidae)
- Porifera (Hard substrate sponge)

Additionally faunal turf and bioturbation in the form of tracks and burrows were observed. Two observations of anthropogenic debris, in the form of plastic, were recorded at Stations ENV220 and ENV222 and are shown in Figure 2.1.

Overall, fauna was typically sparse throughout the survey area with only 38% of usable stills containing visible fauna. This sparsity of visible fauna was most notable in the northern area where only 26% of usable stills contained visible fauna, whereas almost half (45%) of usable stills from the central area contained visible fauna. Across the survey area the most frequently observed taxa and/or features were as follows:

- Burrows, present at 29 stations from the central and southern areas and in 13% of usable images.
- Faunal turf, present at 25 stations and 10% of usable images, mainly from the southern area.
- *A. digitatum,* present at 33 stations from the northern and southern areas and in 8% of usable still images.
- *P. phosphorea,* present at 11 stations from the central area and in 6% of usable stills.

Figure 2.1 Examples of Anthropogenic Debris

Station: ENV200 Fix: 1840

Station: ENV222 Fix: 1743

2.3 Species of Conservation Interest

A total of eight pairs of siphons, thought to be the bivalve *A. islandica,* were observed in imagery across three stations (Stations ENV174, ENV175 and ENV178). This species is on the OSPAR (2008) list of threatened and/or declining species and habitats. In addition, it is listed as a low or limited mobility species PMF in Scottish offshore waters (NatureScot, 2020); however, this species is commonly found within this area of the North Sea.

A total of fifteen individuals of the witch flounder; *G. cynoglossus* were observed across twelve stations. This species is classified as vulnerable on the global IUCN Red List (2025).

Two individuals of angler fish (*L. piscatorius*) were observed in imagery across two stations within English waters (Stations ENV198 and ENV225). This slow growing species which is vulnerable to fishing is listed on the UK Post-2010 Biodiversity Framework (JNCC and Defra, 2012) as a priority species.

Sixteen individuals of plaice (*Pleuronectes platessa*) were observed in imagery across nine stations (Stations ENV173, ENV179, ENV206, ENV212, ENV221, ENV223, ENV228, ENV232 and ENV236). This species is classified as a priority species under the UK Post-2010 Biodiversity Framework (JNCC and Defra, 2012) and is on the Scottish Biodiversity List (NatureScot, 2020).

A total of thirty-five individuals of the urchin *E. esculentus* were identified across seven stations (Stations ENV188, ENV197, ENV198, ENV234, ENV219, ENV238 and ENV240). This species is classified as near threatened on the IUCN (2025) Global Red List.

Other than those species mentioned above and habitats discussed in Sections 2.6 to 2.9, there was no further evidence from seabed imagery of habitats listed under Annex I of the Habitats Directive (1992), habitats or species of FOCI (2018), priority habitats or species (JNCC and Defra, 2012), species or habitats selected as PMFs (NatureScot, 2020). Nor any species listed on the Scottish Biodiversity List (2020), species or habitats listed on the OSPAR (2008) list of threatened and/or declining species and habitats or species on the IUCN (2025) Global Red List.

2.4 Sediment Sampling Observations

Sediment sampling was conducted at 52 stations across the survey area, with the required suite of samples collected at 49 stations as per the SOW (bp, 2023; 2024). All successful samples were acquired using a 0.1m^2 Day grab. Environmental deck and positioning logs are presented in Appendix A, with example images presented in Appendix C.

Excluding sampling at the superseded Station ENV235, a total of 177 grab samples were acquired from 215 attempts (82% success rate). Of these retained samples, 99% were acquired within 10m from the target location, with the remaining sample (from nearshore Station ENV200) acquired 20m from the target. On average, samples were obtained within 1.6m of the target locations (±1.8SD). The 38 unsuccessful sampling attempts occurred across 18 stations, most of which were from the southern area. Samples were largely rejected due to low sample retention, stones in the grab jaws and misfiring of the grab associated with coarse sediments at seabed, other than at Station ENV226, where the presence of Myxinidae resulted in sample rejection.

Seabed sampling supported the initial interpretation of the seabed imagery findings at these stations, confirming that the seabed comprised sandy sediment with varying amounts of fines, shell fragments and occasional areas of muddy sediment with cobbles; the latter being restricted to stations in the southern area.

Visible fauna observed with the retrieved grab were limited and included:

- Annelida (Polychaeta)
- Arthropoda (Brachyura, Crustacea, Corystidae, Paguroidea)
- Cnidaria (Alcyoniidae, Pennatuloidea)
- Echinodermata (Echinoidea, Ophiuroidea, Spatangoidea)
- Mollusca (Bivalvia, Gastropoda, Pharidae, Scaphopoda)

2.5 Particle Size Analysis

The results of the PSA, determined using wet and dry sieving, are summarised in Table 2.1. Full results, including histograms illustrating the particle distribution at each of the 49 sampled stations, are presented in Appendix F. The results of the PSA were consistent with observations from seabed imagery and the recovered sediment samples.

Along the route, sediments were recorded as heterogenous, ranging from very poor to moderately sorted sediment under Folk & Ward (1957). Mean particle diameter ranged between 12µm at Station ENV215 and 927µm at neighbouring Station ENV214 which is described under Wentworth (1922) classification as fine silt to coarse sand. Most stations recorded poorly to very poorly sorted sediment (n=44, 90%) with fine skewed distributions (fine or very fine skewness; n=43, 88%). When classified under modified Folk (1954), sediments were predominantly muddy sand (n=26; 53%) or sandy mud (n=12; 24%) and these stations recorded modal phi values between 1.5 and 7.0 (Appendix F).

Of the 49 stations where PSA was collected, all stations recorded negligible (<5%) gravel (≥2mm) content, except for southern Stations ENV214 and ENV222 which recorded 30.2% and 54.6% gravel content, respectively. All stations in the northern and central areas were dominated by sand (≥63µm and <2mm; >72%), whereas fifteen stations in the southern area were dominated (>50%) by sand and twelve were dominated (>50%) by fines (<63µm;silt and clay).

1 Statistics according to Folk and Ward (1957).

2.6 Herring Spawning Ground Potential

The stations along the route coincided with a potential herring nursery ground (Ellis *et al.*, 2012), therefore, all 49 stations where PSA samples were acquired have been assessed for their spawning potential. Observed water depths along the route ranged from 11m to 93m, which lies within a suitable depth range for herring spawning (ICES, 2024). Based on criteria by Reach *et al.* (2013), and with consideration of Cefas (2001), as outlined in Appendix B.7.1, the spawning potential of each relevant aspect of the PSA data are reported in Table 2.2. Full PSA results are presented in Appendix F.

Based on the results of the PSA, only Stations ENV214 and ENV222 met the suitability criteria in that these stations recorded >10% gravel and a Wentworth (1922) classification of coarse sand. However, none of the stations where PSA was collected recorded sufficiently low percentage fines (<5%) in combination with high enough (>10%) gravel content to be considered prime in terms of habitat sediment preference for herring spawning.

In terms of habitat sediment classification, Stations ENV214 and ENV222 offered the greatest potential for herring spawning, being regarded as sub-prime as they recorded a modified Folk (1954) classification of muddy sandy gravel.

There were no stations within the survey area that presented a well sorted substrate, therefore the sediments are likely to be less oxygenated and offer less favourable conditions for herring spawning.

As acknowledged by Reach *et al*. (2013) and as previously defined by Cefas (2001), use of the modified Folk classification alone may over-estimate the suitability of an area in terms of its herring spawning potential as further consideration should be given to other environmental (physical, chemical and abiotic) parameters such as oxygenation, siltation, micro-scale morphological features (*e.g.* ripples and ridges). Furthermore, the area must be exposed to the main flow of water and the sediments wells sorted to ensure maximum oxygenation of the sediment and hence the lower layers of herring eggs; the area should be elevated with respect to the surrounding seabed.

Table 2.2 Summary of Herring Spawning Potential

Area	Station	Dominant Grain Size			Habitat Sediment Preference[1]			Habitat Sediment Classification[2]

Classification criteria are detailed in Appendix B.7.1.

1 Habitat Sediment Preference - Colours indicate where Prime, Sub-Prime, Suitable or Unsuitable spawning potential criteria were met (Reach *et al.*, 2013).

2 Habitat Sediment Classification - Colours indicate where Preferred, Marginal or Unsuitable spawning potential criteria were met (Reach *et al.*, 2013).

2.7 Sand Eel Spawning

The stations along the route coincided with low intensity spawning and nursery grounds for sand eel (Ellis *et al.*, 2012), therefore, all 49 stations where PSA samples were acquired have been assessed for their spawning potential. Observed water depths along the route ranged between 11m and 93m, which is within the sand eel preferred depth range. Based on criteria defined by Latto *et al.* (2013) as outlined in Appendix B.7.2, the spawning potential of each relevant aspect of the PSA data are presented in Table 2.3. Full PSA results are presented in Appendix F.

Based on the results of PSA, six stations (Stations ENV173, ENV174, ENV179, ENV232, ENV234 and ENV235A) met at least one of the suitability criteria in that they recorded <10% fines and >50% sand along with a suitably low (<15%) percentage gravel. Of these stations, all six met the preferred habitat sediment classification of sand.

Of the remaining stations, 30 were dominated by sand (>50%), however, with >10% these stations were unsuitable for sand eel spawning.

Sand eels were found by Holland *et al.* (2005) to prefer sediments finer than 0.25mm, which cover muds and a portion of the sand fraction and therefore includes a portion of less suitable sediment. Latto *et al.* (2013) bases its categorisation of the sediment on the modified Folk (1954) classification for comparison to the pre-existing BGS charts to allow a broadscale assessment of potential sand eel spawning suitability and this method is likely to overstate the suitability of sediment to support populations of sand eels.

Table 2.3 Summary of Sand Eel Spawning Potential

Classification criteria are detailed in Appendix B.

1 Habitat Sediment Preference - Colours indicate where Prime, Sub-Prime, Suitable or Unsuitable spawning potential criteria were met (Latto *et al.*, 2013).

2 Habitat Sediment Classification - Colours indicate where Preferred, Marginal or Unsuitable spawning potential criteria were met (Latto *et al.*, 2013) based on either the sand and fines criteria or the generalised criteria.

2.8 Sea Pen and Burrowing Megafauna Communities

Seabed imagery revealed that burrows were present at 29 stations and two species of sea pen (*P. phosphorea* and *Virgularia*) were present at 15 stations. Therefore, a detailed assessment of the sea pen and burrowing megafauna community habitat as identified by OSPAR (2010) was conducted, referring to the MNCR SACFOR abundance scale (JNCC, 2013). Sea pen and burrow densities were calculated for each station using the total area covered by the seabed imagery (average image area x number of images). The results of the assessment are summarised in Table 2.4 with the abundances of burrows and sea pens presented spatially in Appendix C.

A total of 576 burrows were recorded across 29 stations, with densities ranging from 0.05 burrows m^{-2} at Station ENV172 to 8.15 burrows m^{-2} at Station ENV224. Burrows across the surveyed area ranged between 0.5cm and 12.8cm in diameter. In accordance with the SACFOR scale, burrows were classified in a range that encompassed frequent at 23 stations; all of which were in English waters. Although burrows were present, burrowing fauna were rarely sighted with only seven individuals of *N. norvegicus* observed across the survey area to confirm the burrow inhabitants, therefore; many burrows could not confidently be attributed to any of the classified megafauna species within the sea pen and burrowing megafauna community habitat classification.

A total of 188 individuals of *P. phosphorea* were observed across 11 stations along the route. Where observed, densities of *P. phosphorea* ranged from 0.18 individuals m^{-2} at Station ENV232 to 1.95 individuals m^{-2} at Station ENV172, with individuals measuring between 0.5 and 17.0cm. In accordance with SACFOR, where observed *P. phosphorea* were classified in a range that encompassed frequent at 10 stations.

Further, a total of 22 individuals of *Virgularia* were observed across 5 stations. The density of *Virgularia* varied from 0.08 individuals m^{-2} at Stations ENV187 and ENV230 to 1.16 individuals m^{-2} at Station ENV208, with individuals measuring between 0.8 and 14.3cm. In accordance with SACFOR, *Virgularia* were classified in a range that encompassed frequent at Stations ENV207, ENV208 and ENV224.

The JNCC (2014b) clarification report states that to be considered a sea pen and burrowing megafauna communities habitat, densities of burrows and/or mounds, together with sea pens if present, should be classified as frequent or above on the SACFOR scale. Of the 29 stations where burrows were observed, 23 were in a range to be considered to show some similarity to a sea pen and burrowing megafauna communities habitat (OSPAR, 2010). Of these 23 stations, 5 (Stations ENV187, ENV210 to ENV212 and ENV230) could be considered as showing the greatest similarity to a sea pen and burrowing megafauna communities habitat in that burrows encompassed the SACFOR ranges frequent to common.

Whilst this habitat is on the list of threatened and/or declining species and habitats, it is widespread throughout the central North Sea, around the south and west coasts of Norway and around the north of the British Isles (OSPAR, 2010; Hill *et al.*, 2022). This habitat is also listed as a component biotope of the burrowed mud habitat which is a PMF (NatureScot, 2020); however, no burrows were observed at any station in Scottish waters.

Table 2.4 Total Sea Pens and Faunal Burrows Qualification

2.9 Stony Reefs

Analysis for stony reef was conducted to determine the resemblance, if any, to the protected habitat based on the criteria adopted by Irving (2009) as set out in Appendix B. Seabed imagery and sediment composition showed evidence of potential rocky reef at 17 of the 59 stations along the route, in the form of cobbles and/or boulders or isolated patches of cobbles or scattered cobbles. The HD video at the seventeen stations was segmented and reviewed for resemblance criteria as described by Irving (2009). Results of the stations assessed are presented in Table 2.6 with further details of station segmentation provided in Appendix G.

Following review of the video, Station ENV234 revealed no resemblance to rocky reef due to a singular, isolated boulder observed with the rest of the station found to comprise flat soft sediment. Station ENV221 revealed isolated patches of cobbles and/boulders interspersed with areas of flat soft sediment, therefore this station did not meet any criteria to be classed as stony reef.

Of the remaining stations assessed for stony reef, twelve stations were observed to be matrix supported, however; Stations ENV182, ENV188 and ENV240 were predominantly clast supported.

Following video segmentation, nine stations (Stations ENV183, ENV197 to ENV200, ENV203, ENV205, ENV218 and ENV239) showed low resemblance to a stony reef, with between 13% at Station ENV205 and 62% at Station ENV203 of the station comprising potential stony reef habitat.

A further six stations (Stations ENV182, ENV188, ENV204, ENV219, ENV238 and ENV240) showed medium resemblance to a stony reef, with between 32% at Station ENV204 and 100% at Station ENV188 of the analysed area comprising low to medium resemblance to a stony reef.

Additionally, at all stations analysed for stony reef, epifaunal coverage showed a limited increase in areas of cobbles and boulders compared to the surrounding substrate. Further, some species known to be strong indicators of reef habitat were observed including *A. diaphanum*, *E. esculentus inc*., *O. nigra* and *S. rosea*. However, these species were not limited to the areas of cobbles and/or boulders but were rather seen across all coarse sediment types observed along the route.

Table 2.6 Stony Reef Assessment Summary

Area	Station	Transect Length (m)	Mean Swathe Width (m)	Estimated Area Investigated (m^2)	Low Resemblance (10-40%)			Medium Resemblance (40-95%)			Proportion of station with reef coverage (%)	Resemblance to 'Stony Reef'[2]	Comments

1 Reef height calculated based on average imagery measurements within the segment.
2 Resemblance to Stony Reef – Colours indicate where Medium, Low or Not stony reef criteria were met (Irving, 2009)
NC Not calculated.

2.10 EUNIS Habitat Classification

Each seabed photograph and captured seabed image was assigned a EUNIS Habitat classification based on observed depth, sediment type and visible fauna. These results were then reviewed alongside available PSA results to assign one or more EUNIS habitat codes to each station, the results of which are summarised in Table 2.7 and plotted in Figure 2.2.

All observed habitats related to the EUNIS level 1 environmental marine habitats (EUNIS habitats type code M). Two level 2 broad habitats were identified based on water depth:

- EUNIS broad habitat code MC, marine benthic circalittoral habitats corresponding to sediment habitats in less than 50m water depth. Circalittoral sediments can range from rock, cobbles and boulders to sand, mud and mixed sediments (EEA, 2019).
- EUNIS broad habitat code MD, marine benthic offshore circalittoral habitats corresponding to sediment habitats in deeper water, further from the coastline. Offshore circalittoral sediments can range from cobbles and boulders to sand, fine sand, mud and mixed sediments (EEA, 2019).

Of the offshore stations, where predominantly sandy sediment was observed, fifteen stations were classified as EUNIS biotope complex MD521: faunal communities in Atlantic offshore circalittoral sand. This habitat is described by EEA (2019) as offshore circalittoral habitats with fine sands or non-cohesive muddy sands.

Where the PSA analysis indicated sediments were dominated by sand on the southern area of the route, seven stations were solely classified as EUNIS biotope complex MC521: faunal communities in Atlantic circalittoral sand. This habitat is described by EEA (2019) as circalittoral non-cohesive muddy sands with the silt content of the substratum typically ranging from 5 to 20%.

In the southern area of the route, thirteen stations were classified as EUNIS biotope complex MC621: faunal communities in Atlantic circalittoral mud. This habitat is described by EEA (2019) as sublittoral muds, occurring below moderate depths of 15-20 m. Of these stations, twelve were refined to the EUNIS biotope MC6216: sea pens and burrowing megafauna in Atlantic circalittoral fine mud.

Nine stations were classified as EUNIS biotope complex MC421: faunal communities of Atlantic circalittoral mixed sediment due to PSA indicating mixed sediment, and where no PSA data were acquired, seabed imagery indicated mixed sediments. This habitat is described by EEA (2019) as mixed sediment habitats generally below 15 to 20 m including well mixed muddy gravelly sands or very poorly sorted mosaics of shell, cobbles and pebbles embedded in or lying upon mud, sand or gravel.

Three stations (Stations ENV182, ENV188 and ENV219) were classified to EUNIS biotope complex MC121: faunal turf communities on Atlantic circalittoral rock, indicated by the increase in boulders observed at these stations.

Twelve stations were classified to multiple EUNIS classifications due to a mixture of sediments observed within the imagery.

- Nine stations were classified to MD52: Atlantic offshore circalittoral sand and MC6216: sea pens and burrowing megafauna in Atlantic circalittoral fine mud
- Two stations were classified to MC521: faunal communities in Atlantic circalittoral sand and MC121: faunal turf communities on Atlantic circalittoral rock
  Station ENV203 was classified to MC621: faunal communities in Atlantic circalittoral mud and MC121: faunal turf communities on Atlantic circalittoral rock

APPENDIX A FIELD SAMPLING LOGS

Gardline — Seafloor Sampling Positioning Summary

Job No	59294			Vessel	MV *Ocean Reliance*						
Client	Morven Offshore Wind Limited			Vessel Reference Point (VRP)	COG						
Project Name	Morven Grid Connection 1 Route Environmental Survey			Deployment Location	Starboard A-Frame Mid	x	9.31	y	-14.81	z	5.97
Primary Positioning System	C-Nav 3050 (A)			Actual Coordinates derived from	Beacon						
Geodetic Reference System	Datum	WGS 84 (18) to ED50	Ellipsoid	International 1924	Projection	UTM zone 30N (3°W)			Vertical / Tidal Datum	MSL	

Date	Time (UTC)	Fix number	Stn No	Penetration %	Sample Retention	Retention	Observed Seafloor Depth (m)	Actual coordinates		Target coordinates		Offset from target				Surveyor	Remarks
								Easting	Northing	Easting	Northing	dE	dN	Range	Bearing

APPENDIX A FIELD SAMPLING LOGS

Gardline — Seafloor Sampling Positioning Summary

Job No	59294			Vessel	MV *Ocean Reliance*						
Client	Morven Offshore Wind Limited			Vessel Reference Point (VRP)	COG						
Project Name	Morven Grid Connection 1 Route Environmental Survey			Deployment Location	Starboard A-Frame Mid	x	9.31	y	-14.81	z	5.97
Primary Positioning System	C-Nav 3050 (A)			Actual Coordinates derived from	Beacon						
Geodetic Reference System	Datum	WGS 84 (18) to ED50	Ellipsoid	International 1924	Projection	UTM zone 30N (3°W)		Vertical / Tidal Datum	MSL		

Date	Time (UTC)	Fix number	Stn No	Penetration %	Sample Retention	Retention	Observed Seafloor Depth (m)	Actual coordinates		Target coordinates		Offset from target				Surveyor	Remarks
								Easting	Northing	Easting	Northing	dE	dN	Range	Bearing

APPENDIX A FIELD SAMPLING LOGS

Gardline — Seafloor Sampling Positioning Summary

Job No	59294			Vessel	MV *Ocean Reliance*						
Client	Morven Offshore Wind Limited			Vessel Reference Point (VRP)	COG						
Project Name	Morven Grid Connection 1 Route Environmental Survey			Deployment Location	Starboard A-Frame Mid	x	9.31	y	-14.81	z	5.97
Primary Positioning System	C-Nav 3050 (A)			Actual Coordinates derived from	Beacon						
Geodetic Reference System	Datum	WGS 84 (18) to ED50	Ellipsoid	International 1924	Projection	UTM zone 30N (3°W)			Vertical / Tidal Datum	MSL	

Date	Time (UTC)	Fix number	Stn No	Penetration %	Sample Retention	Retention	Observed Seafloor Depth (m)	Actual coordinates		Target coordinates		Offset from target				Surveyor	Remarks
								Easting	Northing	Easting	Northing	dE	dN	Range	Bearing

APPENDIX A FIELD SAMPLING LOGS

Gardline — Seafloor Sampling Positioning Summary

Job No	59294			Vessel	MV *Ocean Reliance*						
Client	Morven Offshore Wind Limited			Vessel Reference Point (VRP)	COG						
Project Name	Morven Grid Connection 1 Route Environmental Survey			Deployment Location	Starboard A-Frame Mid	x	9.31	y	-14.81	z	5.97
Primary Positioning System	C-Nav 3050 (A)			Actual Coordinates derived from	Beacon						
Geodetic Reference System	Datum	WGS 84 (18) to ED50	Ellipsoid	International 1924	Projection	UTM zone 30N (3°W)		Vertical / Tidal Datum	MSL		

Date	Time (UTC)	Fix number	Stn No	Penetration %	Sample Retention	Retention	Observed Seafloor Depth (m)	Actual coordinates		Target coordinates		Offset from target				Surveyor	Remarks
								Easting	Northing	Easting	Northing	dE	dN	Range	Bearing

APPENDIX A FIELD SAMPLING LOGS

Gardline — Seafloor Sampling Positioning Summary

Job No	59294			Vessel	MV *Ocean Reliance*						
Client	Morven Offshore Wind Limited			Vessel Reference Point (VRP)	COG						
Project Name	Morven Grid Connection 1 Route Environmental Survey			Deployment Location	Starboard A-Frame Mid	x	9.31	y	-14.81	z	5.97
Primary Positioning System	C-Nav 3050 (A)			Actual Coordinates derived from	Beacon						
Geodetic Reference System	Datum	WGS 84 (18) to ED50	Ellipsoid	International 1924	Projection	UTM zone 30N (3°W)			Vertical / Tidal Datum	MSL	

Date	Time (UTC)	Fix number	Stn No	Penetration %	Sample Retention	Retention	Observed Seafloor Depth (m)	Actual coordinates		Target coordinates		Offset from target				Surveyor	Remarks
								Easting	Northing	Easting	Northing	dE	dN	Range	Bearing

APPENDIX A FIELD SAMPLING LOGS

Gardline — Seafloor Sampling Positioning Summary

Job No	59294					Vessel	MV *Ocean Reliance*										
Client	Morven Offshore Wind Limited					Vessel Reference Point (VRP)	COG										
Project Name	Morven Grid Connection 1 Route Environmental Survey					Deployment Location	Starboard A-Frame Mid			x	9.31	y	-14.81	z	5.97		
Primary Positioning System	C-Nav 3050 (A)					Actual Coordinates derived from	Beacon										
Geodetic Reference System	Datum	WGS 84 (18) to ED50		Ellipsoid	International 1924		Projection	UTM zone 30N (3°W)					Vertical / Tidal Datum	MSL			

Date	Time (UTC)	Fix number	Stn No	Penetration %	Sample Retention	Retention	Observed Seafloor Depth (m)	Actual coordinates		Target coordinates		Offset from target				Surveyor	Remarks
								Easting	Northing	Easting	Northing	dE	dN	Range	Bearing

APPENDIX A FIELD SAMPLING LOGS

Gardline — Seafloor Sampling Positioning Summary

Job No	59294			Vessel	MV *Ocean Reliance*						
Client	Morven Offshore Wind Limited			Vessel Reference Point (VRP)	COG						
Project Name	Morven Grid Connection 1 Route Environmental Survey			Deployment Location	Starboard A-Frame Mid	x	9.31	y	-14.81	z	5.97
Primary Positioning System	C-Nav 3050 (A)			Actual Coordinates derived from	Beacon						
Geodetic Reference System	Datum	WGS 84 (18) to ED50	Ellipsoid	International 1924	Projection	UTM zone 30N (3°W)		Vertical / Tidal Datum	MSL		

Date	Time (UTC)	Fix number	Stn No	Penetration %	Sample Retention	Retention	Observed Seafloor Depth (m)	Actual coordinates		Target coordinates		Offset from target				Surveyor	Remarks
								Easting	Northing	Easting	Northing	dE	dN	Range	Bearing

APPENDIX A FIELD SAMPLING LOGS

Gardline — Seafloor Sampling Positioning Summary

Job No	59294			Vessel	MV *Ocean Reliance*						
Client	Morven Offshore Wind Limited			Vessel Reference Point (VRP)	COG						
Project Name	Morven Grid Connection 1 Route Environmental Survey			Deployment Location	Starboard A-Frame Mid	x	9.31	y	-14.81	z	5.97
Primary Positioning System	C-Nav 3050 (A)			Actual Coordinates derived from	Beacon						
Geodetic Reference System	Datum	WGS 84 (18) to ED50	Ellipsoid	International 1924	Projection	UTM zone 30N (3°W)			Vertical / Tidal Datum	MSL	

Date	Time (UTC)	Fix number	Stn No	Penetration %	Sample Retention	Retention	Observed Seafloor Depth (m)	Actual coordinates		Target coordinates		Offset from target				Surveyor	Remarks
								Easting	Northing	Easting	Northing	dE	dN	Range	Bearing

APPENDIX A FIELD SAMPLING LOGS

Gardline — Seafloor Sampling Positioning Summary

Job No	59294			Vessel	MV *Titan Endeavour*						
Client	Morven Offshore Wind Limited			Vessel Reference Point (VRP)	COG						
Project Name	Morven Grid Connection 1 Route Environmental Survey			Deployment Location	Stern A-Frame	x	0.019	y	-5.758	z	1.600
Primary Positioning System	Applanix POSMV			Actual Coordinates derived from	USBL Beacon						
Geodetic Reference System	Datum	WGS84 to ED50	Ellipsoid	International (Hayford) 1924	Projection	UTM zone 30N (3°W)			Vertical / Tidal Datum	LAT	

Date	Time (UTC)	Fix number	Stn No	Penetration %	Sample Retention	Retention	Observed Seafloor Depth (m)	Actual coordinates		Target coordinates		Offset from target				Surveyor	Remarks

APPENDIX A FIELD SAMPLING LOGS

Gardline

Seafloor Sampling Positioning Summary

Job No	59294						Vessel	MV *Ocean Reliance*									
Client	Morven Offshore Wind Limited						Vessel Reference Point (VRP)	COG									
Project Name	Morven Grid Connection 1 Route Environmental Survey						Deployment Location	Starboard A-Frame Mid	x	9.31	y	-14.81	z	5.97			
Primary Positioning System	C-Nav 3050 (A)						Actual Coordinates derived from	Deployment Location									
Geodetic Reference System	Datum	WGS 84 (18) to ED50			Ellipsoid	International 1924		Projection	UTM Zone 30N (3°W)				Vertical / Tidal Datum	LAT			

Date	Time (UTC)	Fix number	Stn No	Penetration %	Sample Retention	Retention	Observed Seafloor Depth (m)	Actual coordinates		Target coordinates		Offset from target				Surveyor	Remarks
								Easting	Northing	Easting	Northing	dE	dN	Range	Bearing

APPENDIX B DATA ACQUISITION AND PROCESSING

APPENDIX B DATA ACQUISITION AND PROCESSING

B.1 Seabed Imagery Acquisition

Environmental seabed images were taken by means of a digital stills shallow water camera system with a dedicated strobe and video lamps, mounted within a stainless-steel frame. Video footage was also acquired throughout transects and station investigations using a HD video. A USBL positioning beacon was attached to the camera frame.

Footage was viewed in real time via an umbilical, assisting in the control of the digital stills camera. This allowed for shot selection to capture sediment changes or features at the seafloor.

During acquisition, a minimum of 35 seabed photographs and 14 minutes of footage were collected at each station/transect at appropriate intervals. The images were captured remotely using the surface control unit.

A total of 2699 photos were taken using the stills camera system across 56 stations and 3 transects. Environmental deck and positioning logs are contained in Appendix A whilst a selection of seabed photographs is presented in Appendix C.

Main instrumental and acquisition details are as follows:

Table B.1 Camera Equipment Specifications

Equipment	HD Camera System	Stills Camera System
Manufacturer	SubC Control Ltd.	Kongsberg/Simrad.
Model	1Cam Alpha MkII/4/6	OE14-208
Lens	Wide angle (26.3mm), f 3.8 ~ 38.0 mm (5/32 ~ 1 1/2 in.), 10x optical zoom and automatic or manual focus control	f 7.2 – 28.8 (35mm format equivalent to 38 – 140mm) 4x optical zoom and automatic or manual focus control
Pixels	12.0 M (Picture mode) OR 8.3 M (Video mode)	5.0 M
Video Resolution	1920 x 1080p	PAL 625 Line / 50 Hz PAL
Image Resolution (pixels)	No stills in HD video mode	2592 x 1944
Field of View	47.8° horizontal (β) by 36.2° vertical (α)	48.4° horizontal (β) by 29.9° vertical (α)
Video Overlay	EdgeDVR Inspection System (Digital Edge Subsea Ltd)	
Trigger	Remote from deck	
Height Control	USBL Beacon and Video footage	
Lighting	1 fixed strobe, 2 fixed LED lamp	
Scale bar	Green line lasers with 100mm (offshore) or 109mm (nearshore) separation between lines.	
Housing	Standard Frame	

Table unit definitions: M = megapixels, p = progressive scan, PAL = phase alternating line, Hz = Hertz

B.2 Benthic Sampling

Benthic samples were recovered using an in-house constructed, modified, stainless-steel 0.1m^2 Day grab. The Day grab carried extra weights where appropriate to induce better penetration on impact and an extended bucket lip to reduce sediment washout. Storm feet and elastic straps were used to reduce the likelihood of the

APPENDIX B DATA ACQUISITION AND PROCESSING

instrument pre-triggering in the water column during deployment. The vessel offset of grab deployment was used to represent the position of the sampler.

Grab sampling operational procedures were as follows:

The Day grab was thoroughly washed using pentane prior to deployment at every station to prevent hydrocarbon cross-contamination. Additionally, bleach was used prior to the acquisition of eDNA samples to prevent the cross-contamination of environmental DNA. A length of 10mm, dry-core, galvanised-steel cable was used to lower the Day grab to the seabed. Positional fixes were taken for each grab sample immediately following the grab reaching the sea floor. The precise time that the grab reached the seabed was determined by observations of the tension on the winch cable.

On recovery of a sample, the grab would first be examined for acceptability following strict quality assurance criteria. In the following cases, a sample would be rejected and the instrument prepared for the next deployment:

1. Jammed sample closure due to entrapment of a large stone, shell or other objects allowing surface sediment washout.
2. Accidental premature opening of sampler on recovery, causing possible surface washout.
3. Half sample obtained where the grab has not struck a flat area of bottom, or not hit true, causing a side or half bite of sediment.
4. Disruption of the sample by obvious shaking or contamination (these can occur when a sample is badly handled or if the grab strikes the side of the vessel during operations).
5. The sample represents less than 40% of the grab's total capacity (*i.e.* less than 6 litres) or totally fills the grab.
6. Sample was acquired more than 20m from the target, as determined by the onboard surveyor.
7. The presence of exopolymeric substances, mucus coagulants and/or fauna that generate them *i.e.* Myxinidae.

Three or four grab deployments were undertaken at each station depending upon requirements for sample collection (see Table B.2, Table B.3 and Table B.4 for sampling requirements). Sediment samples deemed acceptable for analysis were photographed and described prior to sub-sampling.

Surficial (<2cm depth) sediments were taken directly from the Day grab for physico-chemical analysis. All containers were thoroughly washed with appropriate solvents and labelled externally prior to use to remove any organic contaminants. Hydrocarbon samples were placed in 120ml or 1l amber glass jars with solvent cleaned aluminium foil placed between the cap and glass jar, whilst the remaining samples (metals and particle size) were placed in double-lined zip-lock bags. All physico-chemical samples were stored at less than -18°C prior to analysis. Further, two surficial (<2cm depth) sub-samples were acquired from each physico-chemical grab as composites of five sub-samples within a single grab for fish eDNA analysis (one primary and one spare).

Sediment for bacteria and invertebrate eDNA analysis was also required at all stations. Two sub-samples were acquired from each fauna grab, for subsequent analysis (one primary and one spare). All eDNA samples were stored at less than -18°C prior to analysis.

For each faunal sample, following eDNA sub-sample removal, the remaining contents of a single grab were washed into a clean plastic tray using seawater and then transferred to a 0.5mm mesh sieve. Macrofaunal samples were then placed in 1-litre polypropylene, screw-top, squat jars or 5 litre buckets and an additional

APPENDIX B DATA ACQUISITION AND PROCESSING

internal waterproof label was added. Sieved samples were immediately fixed with a known concentration of formaldehyde solution (formalin, less than 20%). The formalin in the sample pots was subsequently diluted to a concentration of approximately 4% and stored at ambient temperature.

Table B.2 Non-Chemistry Stations in Scotland and England

Grab Number	Samples	Consumables
1	Fauna	Fauna buckets
	eDNA	1 ziplock bag
2	Spare Fauna	Fauna buckets
	Spare eDNA	1 ziplock bag
3	PSA	1 ziplock bag
	Spare PSA	1 ziplock bag

Table B.3 Chemistry Stations in England

Grab Number	Samples	Consumables
1	Fauna	Fauna buckets
	eDNA	1 ziplock bag
2	Spare Fauna	Fauna buckets
	Spare eDNA	1 ziplock bag
3	PSA	1 ziplock bag
	Chemistry (MMO)	1 x 1L jar for Hydrocarbons & Organotins, PCBs, metals, TOC
	Fish eDNA	1 ziplock bag
4	Spare PSA	1 ziplock bag
	Spare Chemistry (MMO)	1 x 1L jar spare
	Spare Fish eDNA	1 ziplock bag

Table B.4 Chemistry Stations in Scotland

Grab Number	Samples	Consumables
1	Fauna	Fauna buckets
	eDNA	1 ziplock bag
2	Spare Fauna	Fauna buckets
	Spare eDNA	1 ziplock bag
3	PSA	1 ziplock bag
	Spare PSA	1 ziplock bag
	Chemistry (MMO)	1 x 1L jar for Hydrocarbons & Organotins, PCBs, metals, TOC
	Spare Chemistry (MMO)	1 x 1L jar spare
	Fish eDNA	1 ziplock bag
4	Chemistry (standard)	1 x 120mL jar for Hydrocarbons & Organotins (top 2cm) 1 x 120mL jar for PCBs (top 2cm) 1 ziplock bag for metals, TOC, TOM (top 4 cm)
	Spare Chemistry (standard)	1 x 120mL jar as spare 1 ziplock bag as spare if possible
	Spare Fish eDNA	1 ziplock bag

APPENDIX B DATA ACQUISITION AND PROCESSING

B.3 Redox Procedures

The redox probe combined with oxidation reduction potential, pH and temperature was employed for data collection. The probe was pushed in the sediments to a depth of 1cm and 10cm and the results recorded in the deck field log along with details of sediment colour or odour.

B.4 Water Sampling

Niskin bottles were bleached prior to each deployment to reduce levels of DNA contamination. Niskin bottles were mounted directly to the 10mm, dry-core, galvanised-steel cable with a purse weight to maintain vertical transit and a messenger weight was affixed to allow acquisition of sample. A depth enabled USBL beacon was attached below the Niskin bottle and used to determine depth and location of the Niskin bottle prior to release of the messenger. A fix was taken immediately after release of the messenger and prior to recovery.

On recovery of a sample, the Niskin bottle would first be examined for acceptability following strict quality assurance criteria. In the following cases, a sample would be rejected and the instrument prepared for the next deployment:

1. One or both ends have not released, and the sampler has failed to trigger.
2. One or both ends have failed to seal the sample and water has leaked out
3. Disruption of the sample by obvious shaking or contamination.
4. Sample was taken from an unacceptable distance or depth as determined by the onboard surveyor.

The Niskin bottle contents were then sub-sampled directly from the bottle. Two litres of water each for the primary and spare samples were filtered through a lab-supplied filter using a peristatic pump (Vampire pump) to assist with the process. Samples were preserved within these filters using the supplied preservative solution and then wrapped in a plastic Ziploc bag. Samples were stored at less than -18°C prior to analysis.

B.5 Imagery Processing

Seabed photos were assessed using the Gardline developed imagery analysis program (CountEM). The program allows for individual fauna to be tagged and a sediment description to be assigned to each image. The software allows features to be selected within an image to provide an accurate figure of percentage coverage of each individual element (*e.g.* cobbles and boulders, sponge) based upon the proportion of pixels. CountEM can also measure the area of seabed and observed features primarily in pixels, though this can be converted to millimetres (mm) given a reference scale within the image, such as using two laser lines with a known separation. Further, laser scale lines were used to calculate an approximate area for each photo using methodologies developed from Wakefield and Genin (1987).

Gardline has developed an institution-level reference image catalogue of operational taxonomic units (OTUs) or morphospecies based on Howell *et al.* (2019). Where examples within the images were matched with a morphotype already included within the OTU database these have been given the suffix GLXXXX. To standardise image-based identification, nomenclature based on Horton *et al.* (2021) has been used within the project. *Incerta* (*inc*.) was used to denote where a taxon is identifiable to a certain taxonomic level but the identification is not certain, *indeterminabilis* (*indet*.) was used for a taxon that is unidentifiable below a certain taxonomic level due to image quality or lack of clarity in an image while *stetit* (*stet*.) was used for taxon that are identifiable to a certain taxonomic level with certainty but a decision has been made to not identify further or a lack of resources has led to no further identification.

APPENDIX B DATA ACQUISITION AND PROCESSING

Both the stills and video camera were aligned, so it was possible to cross-check video against stills for protected species/habitats that may have been missed. Video frames were captured whenever the distance between fixes was more than twice the station average and if previously unseen sensitive/protected taxa were visible. This resulted in an additional nine video frames, which were analysed in CountEM.

Further, where potential stony reef habitat was identified during seabed imagery analysis, video segmentation was conducted to enable an assessment of the overall stony reef resemblance and coverage. Video footage was reviewed and segmented based on changes in the sediment composition and habitat type observed. Therefore, one segment would end and another begin at a change in sediment composition. The time stamp of this point was recorded allowing the extraction of a camera position from the logs. To account for patchiness in the habitat, a segment required a minimum length of 5m of consistent habitat in order to be assessed. The area covered was estimated using the image swathe width of the digital stills camera, multiplied by the camera transect or video segment length. It should be noted that the HD video camera has a slightly different aspect ratio, therefore; the estimated resemblance area calculated by video segmentation should be used with caution.

Following quality control, data were exported into an excel file used to summarise seabed imagery observations and allow for further analysis as applicable. A reference collection of taxa ID is presented in Appendix E.

B.6 Particle Size Analysis

Particle size analysis was carried out by Thomson Environmental Consultants Limited in accordance with NMBAQC methods for diamictons (Mason, 2022).

No dispersants were used and the sediment was not treated to remove carbonates or organic matter prior to analysis.

The results, given in Appendix F, present particle size distributions in terms of mean phi, fraction percentages (*i.e.* gravel, sand and fines), sorting (mixture of sediment sizes) and skewness (weighting of sediment fractions above and below the mean sediment size; Folk & Ward, 1957). The sediment samples were additionally classified using the modified Folk triangle classification and the EUNIS classification. These classifications use the sand:mud ratio and the percentage of gravel (Folk, 1954; Parry, 2019).

B.7 Habitat Analysis

B.7.1 Herring Spawning

Determination of spawning potential for a specific area of seabed is been based on guidelines provided by Cefas (2001) and Reach *et al.* (Reach *et al.*, 2013 in; MarineSpace Ltd *et al.*, 2013), summarised in Table B.5, and a variety of measured and inferred sedimentological and hydrodynamic characteristics.

APPENDIX B DATA ACQUISITION AND PROCESSING

Table B.5 Herring Spawning Ground Potential Criteria

Criteria From	Habitat Sediment Preference[1]	Unsuitable	Suitable	Sub-Prime	Prime
Sediment Classes	% Particle Contribution Preference	>5% muds, <10% gravel	<5% muds, >10% gravel	<5% muds, >25% gravel	<5% muds, >50% gravel
	Modified Folk classification (based on sand, mud, gravel fractions above)	Everything excluding gravel, sandy gravel and part gravelly sand	Part gravelly sand	Part sandy gravel and part gravelly sand	Gravel and part sand gravel
Further sediment Description Parameters (including those from Cefas (2001))	% coarse sand to gravel	≤20%	20% to <40%	40% to <60%	≥60%
	Sorting coefficient and description (Folk & Ward, 1957)	≥1.00, poor to extremely poor	0.71 to <1.00, Moderate	0.5 to <0.71, Moderately well	≤0.5, Well
	Wentworth (1922) Classification of mode grain size	Silts and clays	Very fine to medium sand	Coarse to very coarse sand	Granule to pebble
	Exposure	Flat seabed			Elevated (such as raised gravel banks) relative to surrounding seabed
Criteria From	**Habitat Sediment Class[2]**	**Unsuitable**	**Marginal**	**Preferred**	
Sediment Classes	Generalised Folk Classification Preference	All others	Gravelly sand	Gravel and sandy gravel	

1 Colours indicate where Prime, Sub-Prime, Suitable or Unsuitable spawning potential criteria are met
2 Colours indicate where Preferred, Marginal or Unsuitable spawning potential criteria are met

APPENDIX B DATA ACQUISITION AND PROCESSING

B.7.2 Sand Eel Spawning

Determination of spawning potential for a specific area of seabed has been based on guidelines laid out in Latto *et al.* (2013), as summarised in Table B.6.

Table B.6 Sand Eel Spawning Potential

Criteria From	Habitat Sediment Preference[1]	Unsuitable	Suitable	Sub-prime	Prime
Sediment Classes	% Particle contribution preference	>10% muds, <50% sand, >35gravel	<10% muds, >50% sand, <35% gravel	<4% muds, >70% sand, <35% gravel	<1% muds, >85% sand, <15% gravel (inferred)
	Folk classification based on % particle contribution preferences above	All others (including mS, (g)mS, part gmS, part msG and part sG)	Part S, part (g)S, part gS, part sG, part mS, part (g)mS, part gmS and part msG.	Part S, part (g)S, and part gS	Part S, part (g)S, and part gS
Criteria From	Habitat Sediment Class[2]	Unsuitable	Marginal	Preferred	
Sediment Classes	Folk classification generalised	All others	Sandy gravel	Sand, slightly gravelly sand and gravelly sand	

Adapted from Latto *et al.* (2013)

1 Colours indicate where Prime, Sub-Prime, Suitable or Unsuitable spawning potential criteria are met.

2 Colours indicate where Preferred, Marginal or Unsuitable spawning potential criteria are met.

B.7.3 Sea Pen and Burrowing Megafauna Communities

The density classifications as laid out by the MNCR SACFOR scale (JNCC, 2013) were used to quantify sea pens and burrows (see Table B.7). The JNCC (2014b) clarification report specifies that multiple sightings of burrows and/or mounds attributable to relevant species together with sea pens, if present, should be classified as at least frequent for their size on the SACFOR scale in order to be considered a sea pen and burrowing megafauna communities habitat. However, it acknowledges the inherent difficulties of identifying species from burrow type alone using ever evolving guides, such as those cited by the ICES (2011) guide. Subsequently, the overall density of burrows themselves were assessed instead, in order to consider whether their density was a 'prominent' feature of the sediment surface and potentially indicative of a sub-surface complex gallery burrow system.

Table B.7 SACFOR Abundance Scale

Density	Size of Individuals			
	<1cm	1-3cm	3-15cm	>15cm
≥10000 m^{-2}	S	S	S	S
≥1000 m^{-2} to <10000 m^{-2}	A	S	S	S
≥100 m^{-2} to <1000 m^{-2}	C	A	S	S
≥10 m^{-2} to <100 m^{-2}	F	C	A	S
≥1 m^{-2} to <10 m^{-2}	O	F	C	A
≥0.1 m^{-2} to <1 m^{-2}	R	O	F	C
≥0.01 m^{-2} to <0.1 m^{-2}	R	R	O	F
≥0.001 m^{-2} to <0.01 m^{-2}	R	R	R	O
<0.001 m^{-2}	R	R	R	R

S= Superabundant, A = Abundant, C = Common, F = Frequent, O = Occasional and R = Rare. Table amended from: JNCC (2013).
For sedentary species attached to the substratum, percentage cover should be used in preference to the density scale whenever possible.

APPENDIX B DATA ACQUISITION AND PROCESSING

B.8 Stony Reefs

A multi-criteria scoring system; see Table B.8, was used to assess the characteristics of the potential stony reef. Each characteristic was scored as low, medium or high; with spatial extent (m^2), substratum composition (% cover) and elevation (m) as the primary characteristics, as defined by Irving (2009).

Table B.8 Stony Reef Criteria

Characteristic	Resemblance to 'Stony Reef'			
	NOT a 'Stony Reef'	Low	Medium	High
Composition	<10% cobbles/boulders	10 - <40% cobbles/boulders	40 - <95% cobbles/boulders	≥95% cobbles/boulders
		Matrix supported: dominated by sediment	Clast supported: dominated by cobbles/boulders	Clast supported: dominated by cobbles/boulders
Elevation	Flat seabed	<0.064m	0.064 - <5m	≥5m
Extent	≤25m^2	>25m^2	>25m^2	>25m^2
Biota	Dominated by infaunal species			>80% of species present composed of epifaunal species

Stony reef assessment criteria adapted from Irving (2009)

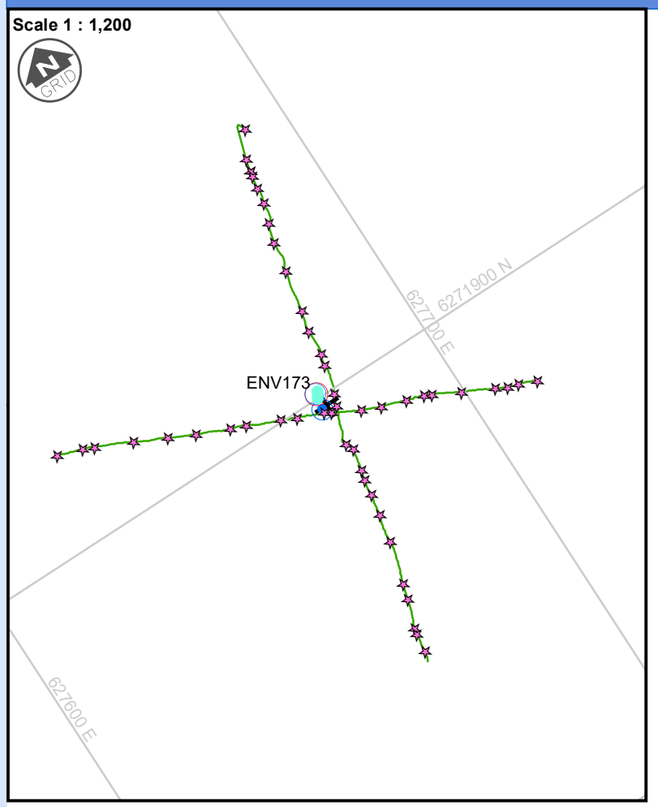
B.9 EUNIS Habitat Classification

Habitat classification is used to identify different habitats and biotopes based on the biotic and abiotic features of the seabed. Habitat and biotope classifications were conducted on the available survey data, adhering to protocols within EUNIS. The system was developed between 1996 and 2001 by the European Environment Agency (EEA) in collaboration with European experts. Table B.9 gives examples of the five EUNIS levels used to describe the marine environments.

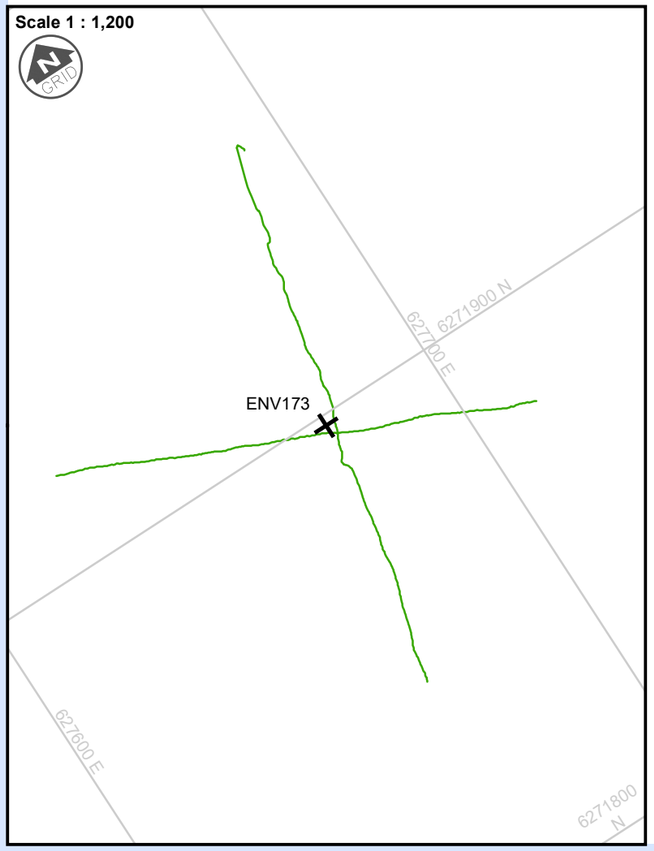
Table B.9 Example EUNIS Habitat Classification Levels

Level	Detail Covered (EUNIS code)
1. Environment	Marine benthic habitats (M)
2. Broad habitats	Circalittoral biogenic habitat (MC2)
3. Main habitats	Atlantic circalittoral biogenic habitat (MC22)
4. Biotope complexes	Worm reefs in the Atlantic circalittoral zone (MC221)
5. Biotopes	*Sabellaria spinulosa* on stable Atlantic circalittoral mixed sediment (MC2211)

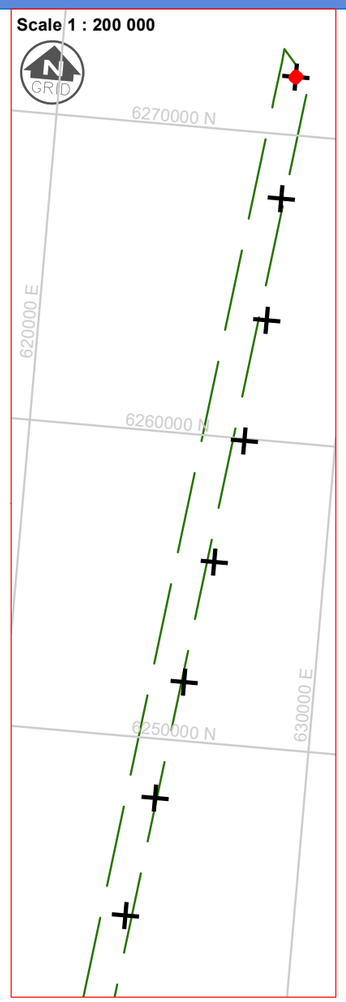
Development of the EUNIS classification comes from both a top-down and a bottom-up approach. The first division is based on differentiating between major biological zones related to depth (littoral down to abyssal) and differentiation of substrate type *(e.g.* rock, sand, gravel). These high-level divisions can be further subdivided based on the main biogeographical regions of Europe's seas (*e.g.* Arctic, Baltic, Atlantic) with these regional splits being based on a combination of salinity and temperature. Such broad-scale differences in habitat character are readily understood by non-specialists and provide classification types that are easily mapped. However, they also have ecological relevance as they reflect major changes in habitat character upon which species distribution depends (Connor *et al.*, 2004).



Bottom-up classification differentiates between places with different species communities. Relative species composition, diversity and abundance vary from place to place and are dependent both on environmental



APPENDIX B DATA ACQUISITION AND PROCESSING



characteristics and upon interactions between species. Surveyed sites with similar environmental characteristics, such as sediment type and depth, show certain levels of similarity in their species communities.

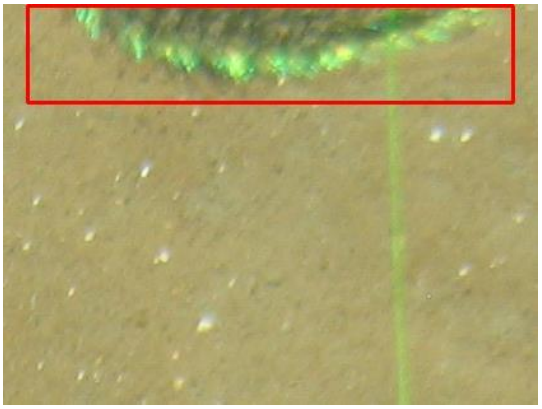
APPENDIX D FAUNAL OBSERVATION SUMMARY

APPENDIX D FAUNAL OBSERVATION SUMMARY

Appendix D is embedded within the pdf as an Excel file named:

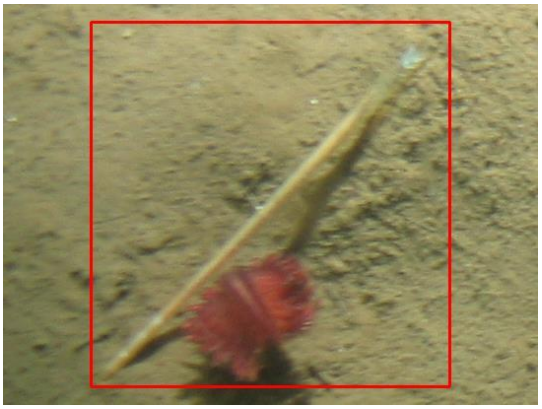
59294_E3 Appendix D - bp Morven Route Faunal Observation Summary.xlsx



It comprises the following tabs:

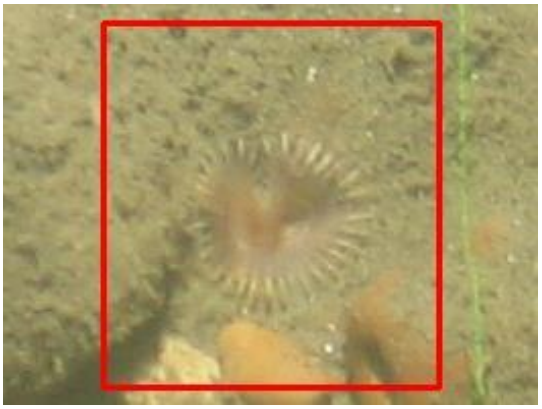
- App D1 Species of Importance
- App D2 Faunal Summary

Press here to show/hide attachment pane



APPENDIX E FAUNAL CATALOGUE

APPENDIX E FAUNAL CATALOGUE



1. Annelida - *Aphrodita aculeata*

Oval bodied worm, sandy coloured body with irridescent chaetae. Two horn-like palps visible from the front of the animal.

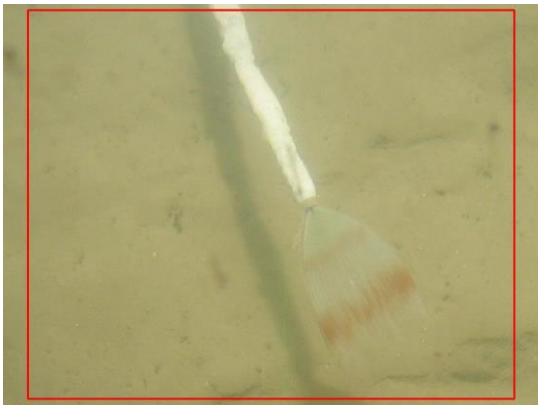
2. Annelida - *Hyalinoecia tubicola*

Long, slender, transparent plastic-looking straw tube resting on the sediment. Worm may be seen emerging from the top of the tube.

3. Annelida - *Myxicola stet.*

Cylindrical worm found emerging from the benthos. Crown of tentacles can be seen with coloured tips either white or black.

4. Annelida - *Oxydromus flexuosus*



Bristle worm seen on the surface of the benthos. Colouration shows dark brown with blue-green stripes across a short and broad body.

APPENDIX E FAUNAL CATALOGUE

5. Annelida - Polychaeta *stet.*

Indistinct polychaete worm found in a burrow. Unable to identify further.

6. Annelida - *Sabella pavonina inc.*

Two fans of feathery tentacles protruding from the end of a long sediment coloured tube. Tentacles are brown-red with darker bands.

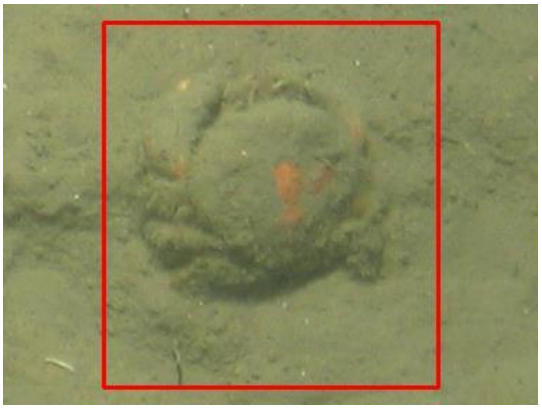
7. Annelida - Terebellidae *stet.*

Tentacles of worm emerging from the sediment. Unable to identify further.

8. Arthropoda - Brachyura *stet.*

Crab with two short chelipeds. Unable to identify further.

APPENDIX E FAUNAL CATALOGUE



9. Arthropoda - *Cancer pagurus*

Heavy, large oval carapace, orange/brown in colour. Distinguisable as having a 'pie crust' edge of the carapace and black tips visible of front chelipeds.

10. Arthropoda - Caridea *stet.*

Small shimp like arthropods sitting on the seabed.

11. Arthropoda - Decapoda *stet.*

Unidentifiable crab with walking legs.

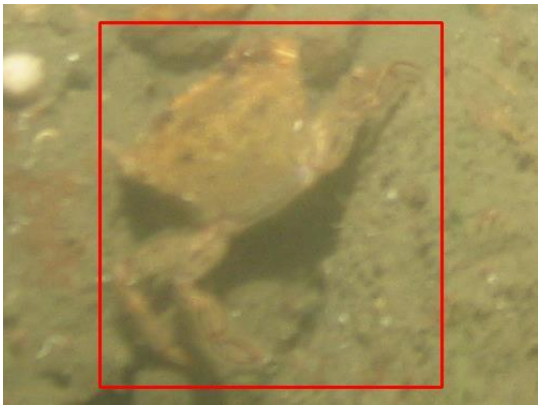
12. Arthropoda - *Ebalia stet.*

Carapace as broad as it is long giving the crab a diamond shape. Front chelipeds are short and thick.

APPENDIX E FAUNAL CATALOGUE

13. Arthropoda - *Goneplax rhomboides*

Small crab with a trapezoid shaped carapace. Each segment of front arms, about as long as the front of the carapace is wide, with pincers approximately half the length of the forearm.



14. Arthropoda - Inachidae *stet.*

Small spider crab with oval or triangular carapace and long thin legs. Two front legs comparatively stout.

15. Arthropoda - *Munida stet.*

The first pair of legs of the lobster are long and thin with slender claws. The back end appears to be blunt and short.

16. Arthropoda - *Necora puber*

Velvet swimming crab. The dorsal surface has a finely velvety texture and the eyes are red.

APPENDIX E FAUNAL CATALOGUE

17. Arthropoda - *Nephrops norvegicus*

Long, pale orange carapace with long spiny rostrum at the front. Long, slender claws with characterised longitudinal spiny ridges.

18. Arthropoda - Paguroidea *stet.*

Hermit crabs living in gastropod shells. Pale red, pink, or orange colouration.

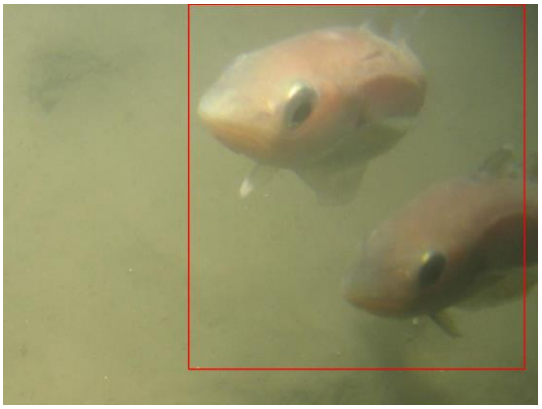
19. Arthropoda - *Pagurus prideaux*

Orange hermit crab. Adults often live in association with the cloak anemone (*Calliactis palliata*).

20. Arthropoda - *Polybius depurator*

Carapace of the crab is wider than long with distinct purple swimming paddles. Front chelipeds are large covering the front of the animal.

APPENDIX E FAUNAL CATALOGUE



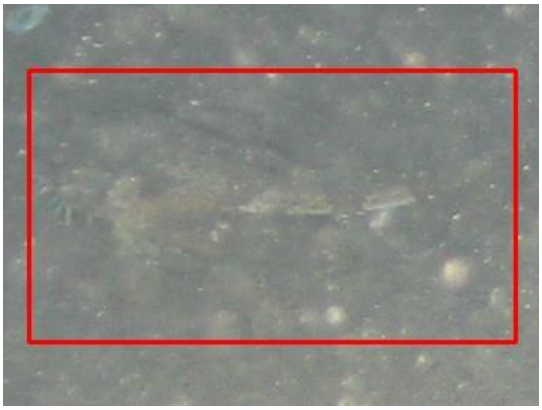
21. Bryozoa - *Alcyonidium diaphanum*

Colonial bryozoan forming various shapes from sausage to flattened lobes. Typically brown in colour and attached to hard substrate including cobbles and shells.

22. Bryozoa - Flustridae *stet.*

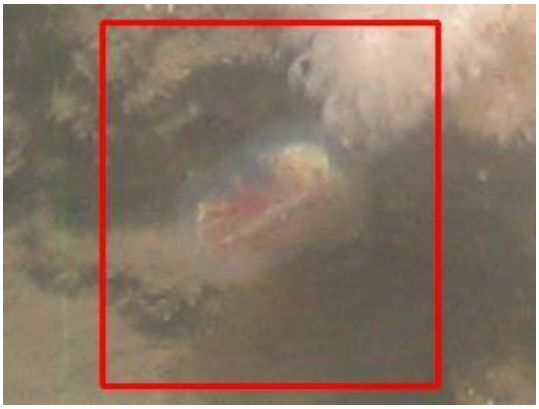
Pale grey-green sheet-like bifurcating structure.

23. Chordata - Actinopterygii *indet*. 01



Pale pink ray finned fish with no characteristic, distinguishing features.

24. Chordata - Actinopterygii *indet*. 02

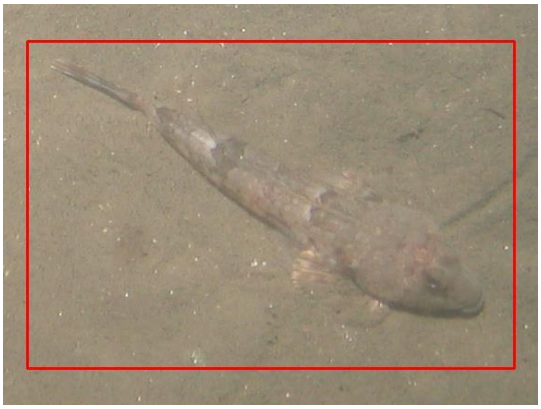


Ray finned fish with slight striped coloration along the body. Unable to indentify further.

APPENDIX E FAUNAL CATALOGUE

25. Chordata - *Agonus cataphractus*

Dull brown and paler on the back with banding pattern. Covered in hard bony plates.



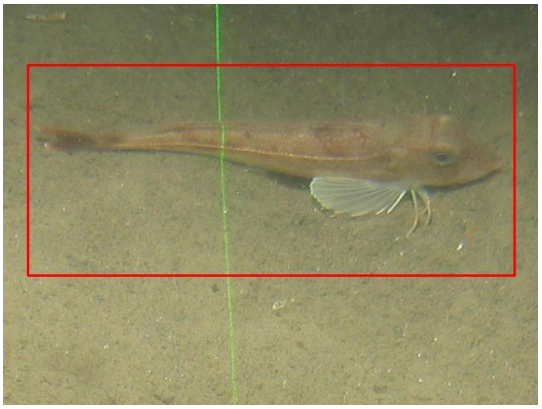
26. Chordata - Ascidiacea *stet.*

Small sea squirt, ovoid in shape with a pale look. Only able to identify to class due to lack of resolution in imagery.

27. Chordata - *Buglossidium luteum*

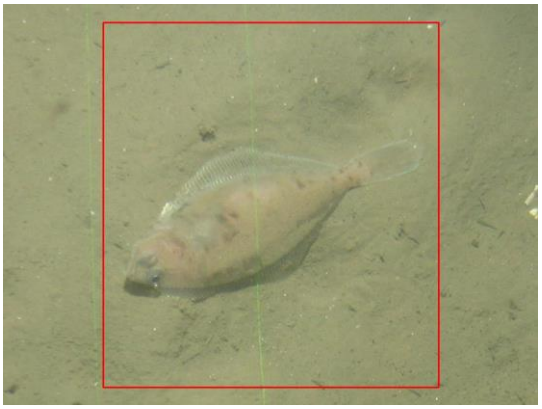
Characteristic oval shape and round head with curving snout. Every fifth or sixth ray of the dorsal or anal fin is black and this gives the fins a striped appearance.

28. Chordata - *Callionymus lyra*



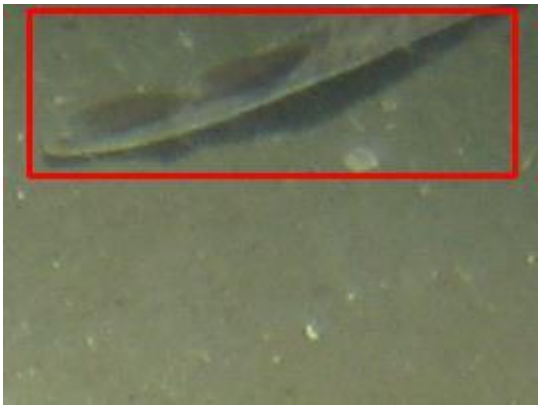
Triangular shaped head, with spiny long pectoral fins and eyes raised above head. Brown in colour with striping, and tapered body into tail fin.

APPENDIX E FAUNAL CATALOGUE



29. Chordata - *Chelidonichthys cuculus*

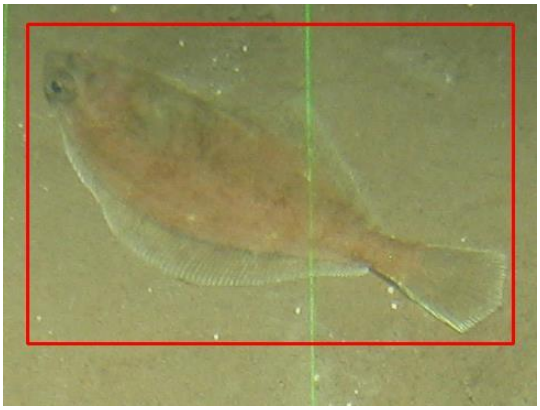
Red gurnard. Has large pectoral fins with finger-like feelers and is usually red in colour with a pale underside.



30. Chordata - *Eutrigla gurnhardus*

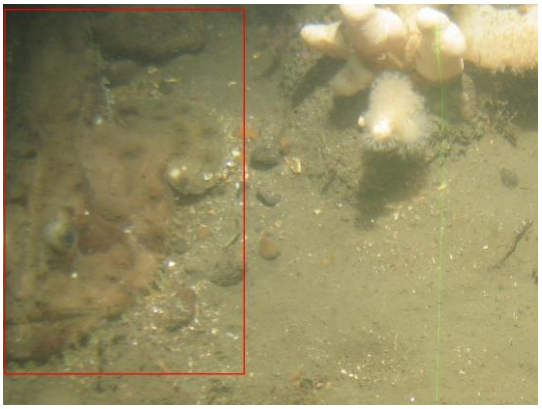
Large head with big eyes tapering evenly down to tail. Three finger-like feelers in front of the pectoral fin.

31. Chordata - *Glyptocephalus cynoglossus*



Right-sided flatfish with large eyes situated closed together. Body elongated and pale brown to pink with dark spots and marking on the pectoral fins.

32. Chordata - *Leucoraja naevus*

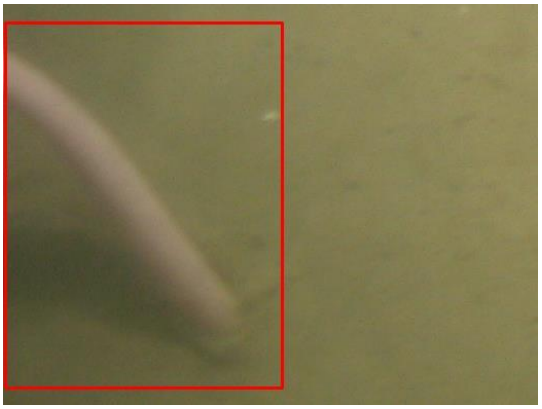


Cuckoo ray, with two visible spines on the tail. Further identified from video analysis.

APPENDIX E FAUNAL CATALOGUE

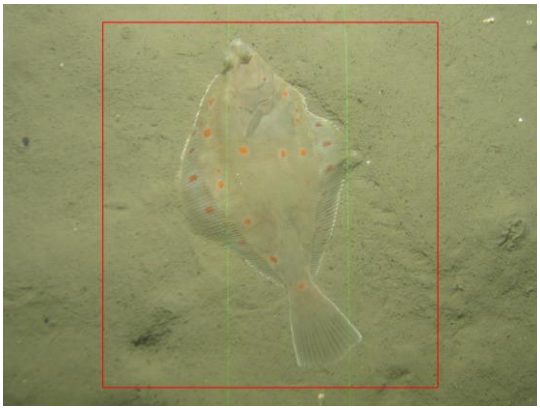
33. Chordata - *Limanda limanda*

Small flatfish with two large eyes and diamond-like shape. Fish is a brown colour with darker blotches and a strongly arched lateral line.



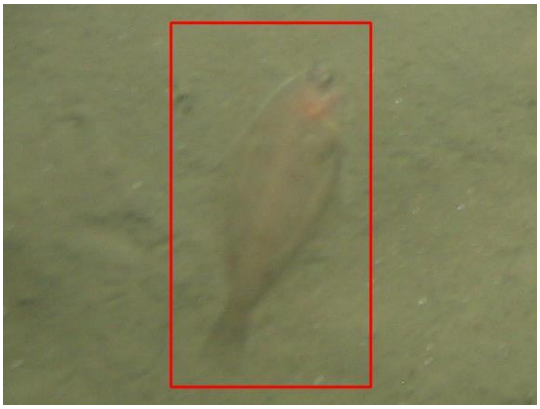
34. Chordata - *Lophius piscatorius*

Broad, depressed body with huge mouth. Fish flabby with a lateral fringe of small flaps.



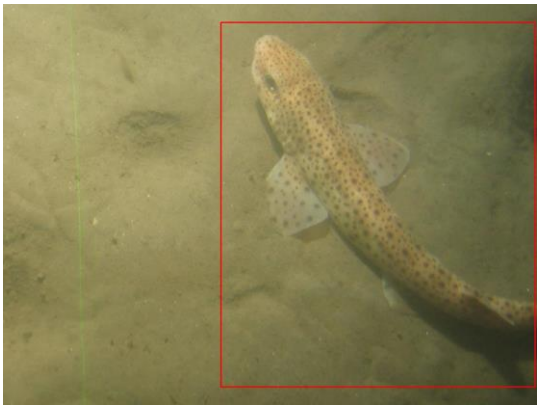
35. Chordata - *Melanogrammus aeglefinus*

Fish with a relatively small head and eyes. Large dark patch on the side of the fish below the first dorsal fin.



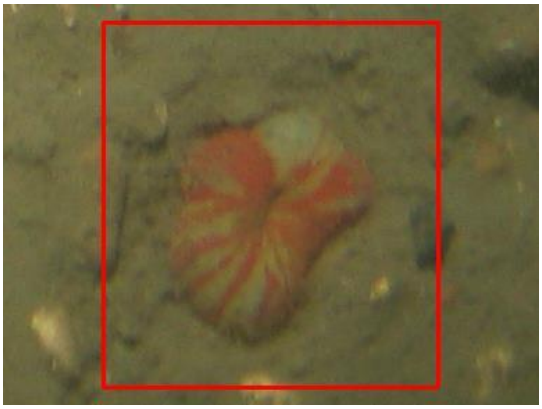
36. Chordata - *Myxine glutinosa*

Long, slender, pale pink coloured eel-like fish.



37. Chordata - *Pleuronectes platessa*

Right-sided greyish brown body with opaque fins with a white margin and orange dots covering both the body and the fins.



38. Chordata - Pleuronectiformes *stet.*

Flatfish with no distinctive markings. Unable to identify further due to lack of ID features.

39. Chordata - *Scyliorhinus canicula*

Small shark with blunt head and long tapering body, with two small, rounded dorsal fins set far back on the tail. Sandy brown colour with numerous, small, darker brown spots.

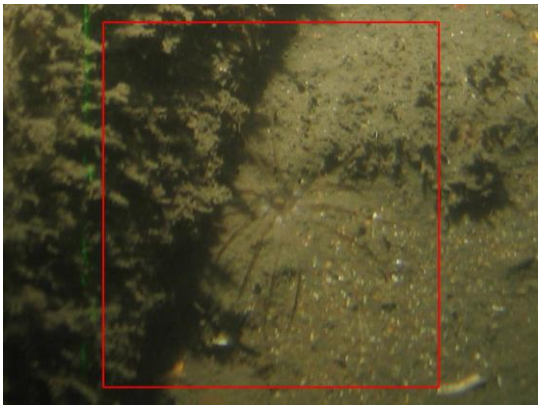
40. Cnidaria - Actiniaria *stet.*

Anemone with no defining features, Unable to identify further.

APPENDIX E FAUNAL CATALOGUE

41. Cnidaria - *Alcyonium digitatum*

Thick fleshy masses of irregular shape which can occur in many colour forms including white, orange, red or brown. Polyps may be retracted, giving a leathery look, or feeding, giving a fluffy look.



42. Cnidaria - *Calliactis palliata*

Cloak anemone living in association with the hermit crab *Pagurus prideaux*.

43. Cnidaria - *Caryophyllia stet.*

Genus of solitary corals. Oval in shape.

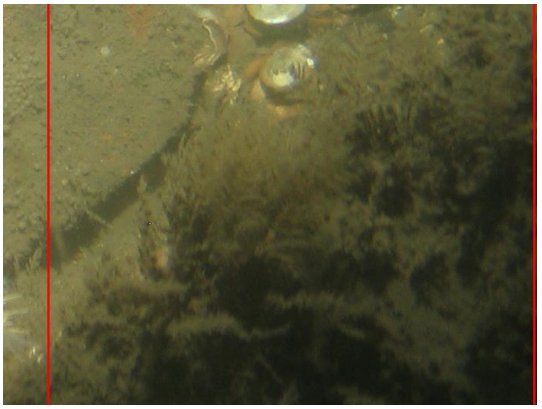
44. Cnidaria - Ceriantharia *stet.*

Solitary tube-dwelling anemones that live buried in the sediment. Only the tentacles and mouth openings are visible.

APPENDIX E FAUNAL CATALOGUE

45. Cnidaria - Edwardsiidae *stet.*

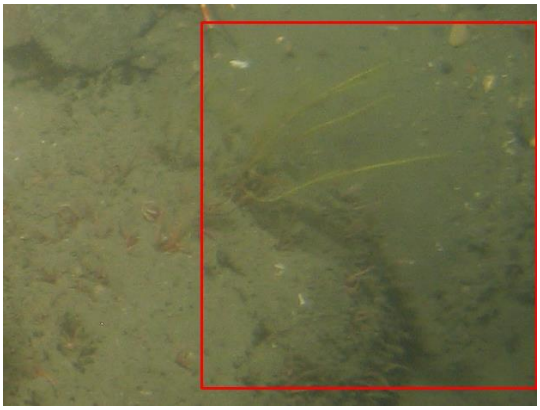
Non-tube dwelling buried anemone with visible tentacles and a small disc. Dark orange in colouration.



46. Cnidaria - Hexacorallia *stet.*

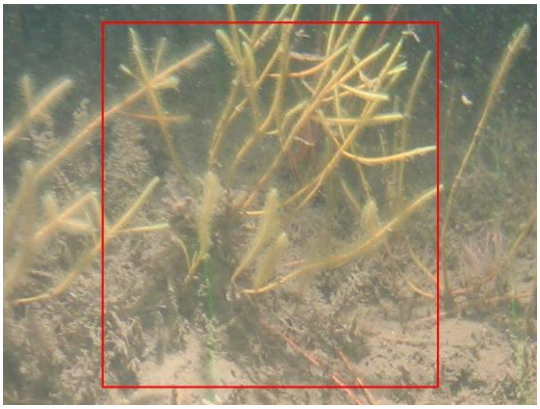
Hexacorallia is a class of Anthozoa that are formed of polyps with more than eight tentacles. Image resolution prevents further identification.

47. Cnidaria - *Hydractinia echinata*



Furry mat with small polyps growing close to the shell, white to pale pink in colour. Often covering gastropod shells typically occupied by hermit crabs.

48. Cnidaria - Hydrozoa *stet.*

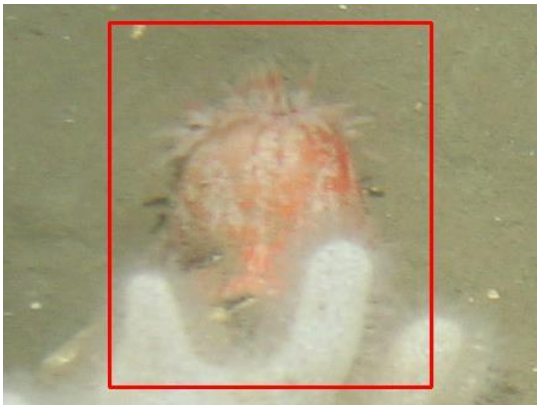


Colonial organism, with multiple polyps connected by tube-like hydrocauli.

APPENDIX E FAUNAL CATALOGUE

49. Cnidaria - *Nemertesia antennina inc.*

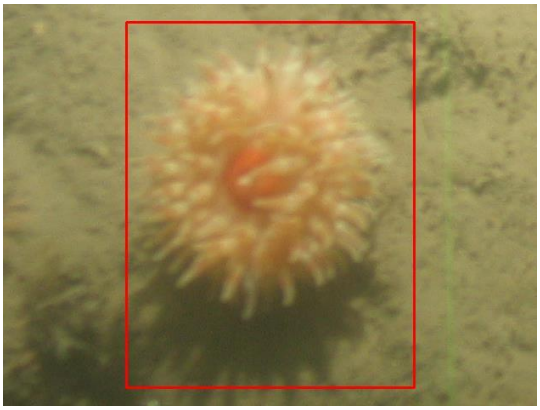
Unbranched colonial hydroid with thick erect stems coming from a central point. The stems are typically pale in colour with a fluffy appearance.



50. Cnidaria - *Nemertesia ramosa inc.*

Branched colonial hydroid with thick erect stems coming from a central point. The stems are typically pale in colour with a fluffy appearance.

51. Cnidaria - *Pennatula phosphorea*

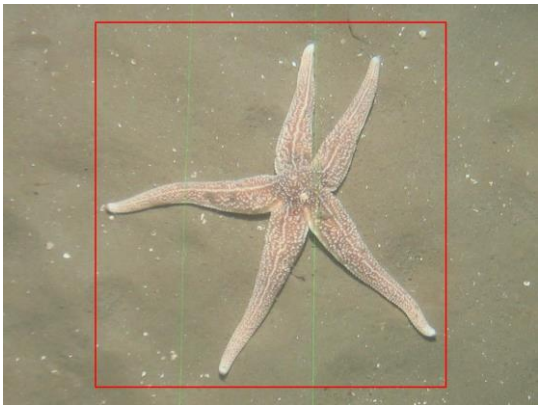


Stout red sea pen with white tips shaped like a fleshy feather.

52. Cnidaria - *Urticina eques*

Anemone with stout tentacles of moderate length. Column smooth with no visible warts.

APPENDIX E FAUNAL CATALOGUE



53. Cnidaria - *Urticina stet.*

Large and colourful anemone with club-like tentacles. Unable to identify to species due to not being able to see the column.

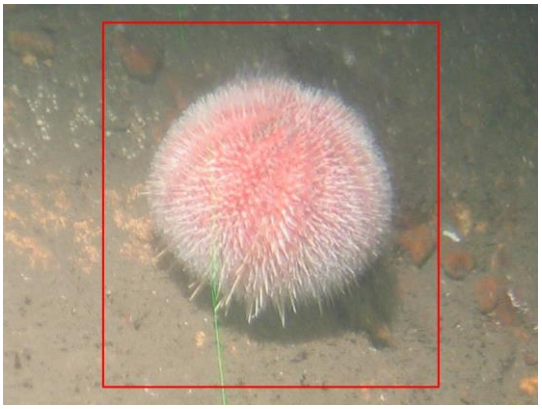
54. Cnidaria - *Virgularia stet.*

Slender sea pen with small leaves. Colour off white to creamy yellow.

55. Echinodermata - *Asterias rubens*

Starfish with five broad arm base and five tapering arms. Variable in colour (orange, pale brown) but frequently with pale tips that are turned up.

56. Echinodermata - Asteroidea *stet.*



Small indistinct starfish. Unable to identify further.

APPENDIX E FAUNAL CATALOGUE

57. Echinodermata - *Astropecten irregularis*

Stiff flatterned body, dorsal surface finely granular, often with purple tips at the end of each arm. At the edge of each arm there is a double series of large marginal plates, thick spines on the edge of all arms.

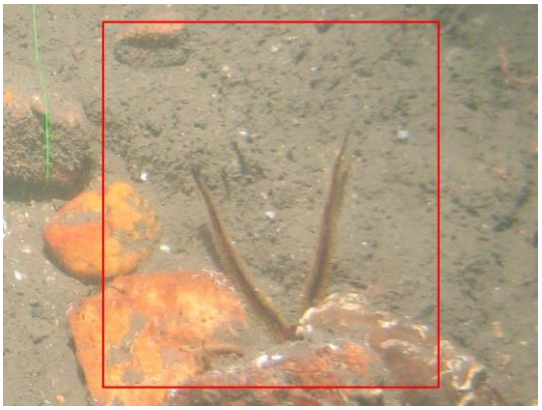
58. Echinodermata - *Echinus esculentus inc.*

Large globular sea urchin may be up to 15cm in diameter. The urchin is typically pink in colour with white spines.

59. Echinodermata - *Henricia stet.*

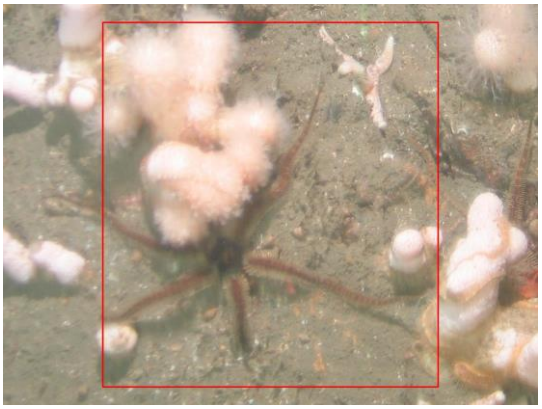
Relatively small starfish with five arms. Arm tips may be pointing upwards.

60. Echinodermata - *Hippasteria phrygiana*



Yellow or orange with a surface covered by small tubercles and a large central disc. Edge of the arms often paler in colour to the main body of the starfish.

APPENDIX E FAUNAL CATALOGUE



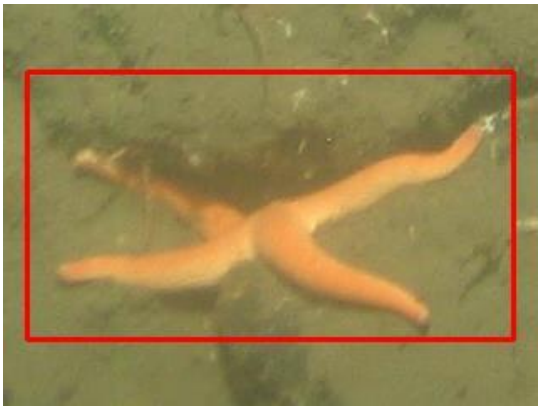
61. Echinodermata - *Luidia ciliaris*

Seven armed starfish, pale orange in colour, with white spines along the underside of each arm. Round central disc with fatter appearance than legs.

62. Echinodermata - *Ophiocomina nigra*

Brittlestar that in this instance is brown/black. Arms and disc are the same colour, and the arms aren't banded.

63. Echinodermata - *Ophiothrix fragilis*



Large brittlestar with slender tapering arms that have 7 spines on each segment, giving them a spiky/fluffy appearance.

64. Echinodermata - Ophiuroidea *stet.*

Brittle star. Defining features not visible.

APPENDIX E FAUNAL CATALOGUE

65. Echinodermata - *Stichastrella rosea*

This starfish has long stiff tapering arms with regular linear pattern of rounded plates on dorsal surface, orange in colour sometimes brighter.

66. Mollusca - *Aporrhais pespelecani*

Tall, slender, conical shell. Outer lip of the opening fans out to five blunt rounded points, the first of which is fused with the conical shape of the shell.

67. Mollusca - *Arctica islandica* siphons

Observed buried in the sediment, seen as two 'pig-nosed' siphons.

68. Mollusca - Bivalvia *stet.* siphons

Bivalve buried in sediment. Two siphons visible with no other identifying features.

APPENDIX E FAUNAL CATALOGUE

69. Mollusca - *Calliostoma zizyphinum*

Straight sided conical shell. Similar to an equilateral triangle in shape.

70. Mollusca - *Coryphella stet.*

Narrow nudibranch with a pink body. The tentacles are located on dorsal surface and these are red with white tips.

71. Mollusca - Gastropoda *stet*.

Small conical shell. Unable to ID any further.

72. Mollusca - Nudibranchia *indet*. GL0001

Narrow nudibranch with a white body. The tentacles are located on dorsal surface, and these have bright white tips.

APPENDIX E FAUNAL CATALOGUE

73. Mollusca - Pectinidae *stet.*

Scallop with few identifying features.

74. Mollusca - Scaphopoda *stet.*

Tusk-shaped white shell typically seen lying on the benthos. Tapering shell with one end thicker than the other and the end of the shell ends with a blunt straight edge.

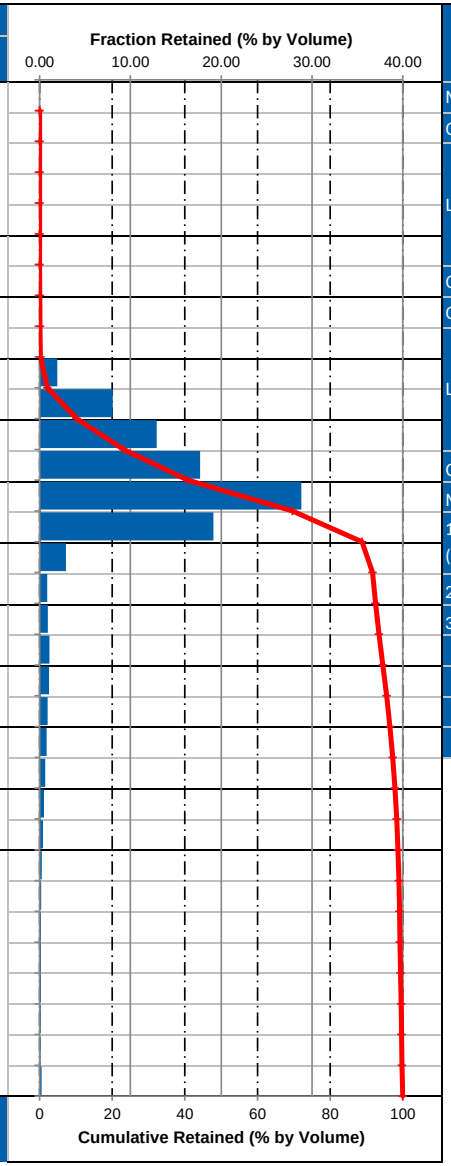
75. Mollusca - Sepiida *stet.*

Bobtail squid. Characterised by the body shape and large eyes relative to the body size.

76. Mollusca - Turritellidae *stet.*

Spiral shell that looks like a unicorn horn.

APPENDIX E FAUNAL CATALOGUE



77. Porifera - Hard substrate

Encrusting Porifera. Unable to identify further due to lack of resolution and physical specimen.

1 Introduction

OWC has been commissioned by Morven Offshore Wind Limited to produce a biotope map for the Morven Hawthorn Pit Grid Connection (MHPGC) project. The objective of this technical note is to provide a summary of the methodology used to interpret the geophysical and environmental data to produce a full coverage biotope map for the MHPGC project.

2 Methodology

The environmental and geophysical survey data from the survey contractors included the following:

- EUNIS habitat classifications at each environmental sample location;
- Full coverage MBES and SSS data and associated reporting; and
- Reporting which identified the ground conditions along the route and geotechnical groupings.

2.1 Data Preparation and Geophysical Interpretation

Upon receipt of the various datasets, a selection was made for integration into a GIS project, with the objective of producing a EUNIS habitat map by correlating the relevant georeferenced data. The results are presented in the GIS package **OWC-056884-001-GIS001-A**, along with chart compilations **OWC-056884-001-DWG001-A** and **OWC-056884-001-DWG001-B**.

The process leading to the final deliverables followed several key steps:

- **Post-processing geophysical data** from the XOcean 2024 “01139” [1] dataset, including creating, merging, reshaping of original rasters and processing to generate derived products (e.g., contours, hillshades, slopes).
- **Gap-filling** within the “01139” dataset by identifying and integrating supplementary geophysical data from the “007411” [2] dataset.
- **Extrapolation of seabed sediment interpretation** to extend coverage over the area provided by the “007411” dataset based on morphological seabed texture.
- **Creation of a simplified representation** of seabed sediments and features.
- **Integration and analysis of geotechnical data** from 2023 and 2024 benthic stations.
- **Multiple iterations of habitat map development**, incorporating feedback from ecology experts through a series of collaborative meetings, reclassifying previously defined seabed zones into habitats (see Section 2.2).
- **Production of charts** to present the final iteration of the habitat map (DWG001-A and DWG001-B).
- **Compilation of all relevant provided, processed, and symbolised data** into a GIS APRX project file (**056884_MV_HabitatModel_GIS_v01_20251027.aprx**).

2.2 Biotope Attribution

The geophysical team worked alongside the ecology team to provide an expert opinion on biotope areas. This included a review of the2023 and 2024 Habitat Assessment Reports and Baseline Survey Reports [3] [4] [5] [6]. EUNIS biotopes were identified using the analysis of benthic grab samples and drop-down video (DDV) footage, alongside the geomorphological terrain assessment to determine areas of seabed that could be categorised as a habitat or biotope. As far as possible, Ramboll's comments, that were provided via email, on the Gardline survey reports were taken into account when reviewing the data and assigning biotopes.

Biotope attribution was carried out by assigning EUNIS biotopes to geomorphological zones via correlating sample station data with geophysical signatures. Where the EUNIS biotope or habitat identified within a sample station between years or by analysis (e.g. grab sample vs drop-down video analysis) were different an additional review of the data was undertaken to determine the best EUNIS classification for the area. This also took into account the data from surrounding stations, and the geophysical interpretation at the site. In some cases, expert judgement was required to determine what biotope was assigned, and in some scenarios a mosaic was assigned due to the available grab sample and DDV survey data and the similarity of the biotopes and sediment types identified within a specific region.

Where a higher-level EUNIS classification was available, this was used as the default for a station or area.

3 Additional Notes

As previously described, in some scenarios expert judgement was used to assign a final habitat, biotope or mosaic to an area. Some notes on specific areas are provided below:

- Where the code "Two Habitats MC6216, MD6218" has been assigned this is as a result of differences in data analysis from the same sampling stations. "MC6216 Seapens and burrowing megafauna in Atlantic circalittoral mud" was identified using the DDV data. "MD6218 *Paramphinome jeffreysii*, *Thyasira spp*. and *Amphiura filiformis* in Atlantic offshore circalittoral sandy mud" was identified using the faunal assessment of the grab sample. It was concluded by an ecology expert that both biotopes are present, and the analysis used to identify them accounts for the difference in which biotope is assigned. Seapens are unlikely to be present within a grab sample but would be visible within DDV footage, and conversely polychaete and bivalve species would be easily identified from a grab sample but unlikely to be visible in stills and video footage.
- The mosaic MC6216/MD6217, MD6218 was assigned due to a difference in biotope classification at survey samples within a similar region between survey years. A review of the data by an ecology expert concluded that, due to the biotopes present, it is likely that there are fluctuations in benthic populations between years but also spatially, therefore altering the biotopes that are recorded. Therefore, it was concluded that a mosaic is the best way to describe the communities likely to be present within this area on present information.
- Some areas of seabed have been classified as a lower level EUNIS habitat e.g. MC121 and MC421. Within these areas one sample station with a higher EUNIS biotope classification was present, however it was not considered sufficient to classify large areas of seabed. Therefore, the lower level EUNIS habitat has been defaulted to.
- Due to lack of survey data, extrapolation of seabed sediment interpretation was required to extend coverage over the area provided by the "007411" dataset. This area is highlighted within the EUNIS Habitat and Seabed Sediment Features chart.

© 2025 OWC

4 Results

The following charts and datasets have been provided as deliverables for this project:

- Chart01_Morven_EUNIS_Habitat
- Chart02_Morven_EUNIS_Habitat_Geotechnical
- Chart03_Morven_EUNIS_Habitat_SeabedSedimentsFeatures
- Chart04_Morven_Seabed_Elevation
- GIS package OWC-056884-001-GIS001-A, which contains:
    - **Geodatabase folder**: Contains all feature classes used in the study and presented in the GIS project and charts.
    - **Geotiff folder**: Contains all raster datasets used in the study and presented in the GIS project and charts.

      Note: Sidescan sonar rasters from the "01139" dataset were excluded from the final GIS project due to file size constraints.
    - **Register**: Provides a detailed listing of all layers included in the Table of Contents of the single map within the GIS project.

5 Staff Expertise

The biotope mapping for the MHPGC project has been undertaken by experts in geophysics, GIS, benthic ecology and marine ecology. The bios for each staff member are provided below, and full CVs are available in Appendix A.

David Rushton

David Rushton holds the role of ABL Chair of Geoscience and oversees the geoscience operations and resourcing across the whole ABL group. David is also the Director of Soil for OWC. David has a background in geotechnical data acquisition and consultancy, starting his career in a major global geotechnical acquisition company, having graduated with an MESc in Earth Sciences from the University of Oxford.

David is an exceptional and dedicated consultant in geotechnical engineering and site investigation design. He has over 15 years of experience in offshore geotechnical data collection, laboratory test specification, parameter assessment, foundation engineering, data interpretation and site-specific analysis for renewable and oil and gas projects.

David has a practical approach to tasks and is readily able to find analytical solutions to geohazard and site characterisation problems, to quantify risk and uncertainties across spatially diverse development sites and deliver fit-for-purpose solutions within realistic project timescales.

Terry Holt

Terry Holt is a Marine Environmental Consultant with extensive experience in marine ecological impact, appropriate and strategic assessments for many major projects. He was a team member for the plan-level HRA assessments for The Crown Estate round 4 project (2021) and FLOW (floating offshore wind, Celtic Seas) 2022. Terry also undertook the lead technical role in benthic ecology section of Irish Offshore Oil & Gas SEA in 2014 and was a member of the expert team responsible for the UK Offshore Energy SEA in 2009. Terry has expertise in renewable energy (wind, wave and tidal), and coastal infrastructure projects such as electricity interconnectors, telecoms cables, ports/marinas, discharges and sea defences.

Terry is highly experienced in the assignment of subtidal and intertidal biotopes, including supporting statistical analysis. He is also experienced at high level reviews of draft survey reports and scoping studies.

Rachel Crabtree

Rachel Crabtree is a Principal Consultant with over ten years' experience working on offshore projects. With a background in marine ecology, Rachel is experienced in undertaking Environmental Impact Assessments (EIA) of marine developments. She has experience working with a variety of clients representing a range of seabed development sectors, both in the UK and Europe, such as marine aggregates; offshore wind farms; offshore transmission owners (OFTOs); interconnector cabling; wave and tidal energy; hydrogen storage; and statutory nature conservation agencies.

Rachel has a strong background within the offshore wind sector, having previously spent three years seconded to Ørsted working with the Environment and Consents team. She specialises in offshore wind and provides support to clients throughout the project life cycle,

© 2025 OWC

particularly in EIA, post-consent compliance, and operations and maintenance. Rachel has experience undertaking benthic ecology assessments for EIA chapters, as well as analysis of video and stills data from benthic surveys to identify sensitive benthic habitats including Annex I habitats.

Corentin Chaptal

Corentin Chaptal is a petroleum geologist by training, with prior experience in the geophysics industry. He joined OWC with a broad skillset encompassing field surveys, data interpretation and analysis, reporting, client communication, 3D modelling, GIS, and data management.

Since joining OWC, Corentin has enhanced his capabilities in GIS—particularly ground modelling—as well as in data management, interpretation, and reporting, including the creation of charts and figures. He has applied these skills across a wide range of offshore wind farm projects already.

Corentin is known for his adaptability, attention to detail, and commitment to meeting client expectations through open communication. These qualities support his effective integration and contribution as a new member of the OWC team.

Isla Symons

Isla is a Graduate Marine Consultant with OWC working within the Environment and Consents team. She has an educational background in both hydrographic surveying and offshore renewable energy and studied a range of topics including renewable energy law and policy, marine economics, marine biodiversity and data processing in a variety of different programmes, including a focus on port and dredging activities. Isla has also had practical experience mobilising and using survey equipment such as MBES, SSS, SBP and more.

She has previously worked within business development in subsea surveying, worked with potential clients on service offerings, developed market
strategy platforms and assisted wider commercial functions on tenders. Isla is now supporting the Environment and Consents team at OWC, assisting on projects throughout the project lifecycle including Pre-FEED, post consent compliance and marine licencing projects. She is also collaborating and working with other departments, assisting on a wide range of projects.

Appendix A CVs

David Rushton

Geotechnical and Geohazard Consultant
Oxford, UK

An exceptional and dedicated consultant in geotechnical engineering and site investigation design. Experienced in offshore geotechnical data collection, laboratory test specification, parameter assessment, foundation engineering, data interpretation and site-specific analysis for renewable and oil and gas projects. Practical and readily able to find analytical solutions to geohazard and site characterisation problems, to quantify risk and uncertainties across spatially diverse development sites and delivering fit-for-purpose solutions within realistic project timescales.

David is a British citizen and a native English speaker.

Qualifications

University of Oxford (2007) BSc and MESc (Oxon) Earth Sciences

Certificates: Offshore Survival (until Nov 2023), UKOOA medical (until Jan 2020), IOSH Managing Safely, CDM Regulations, Minimum Industry Safety Training, H2S Awareness, Faulk Nutec

Experience

ABL Chair of Geoscience (Jan 2021 – Present).

Director of East Point Geo (Nov 2017 – Present).

Innovative Technology Team Leader: Fugro GeoConsulting Limited (Jan 2012 – Nov 2017).

Staff / Project Engineer: Fugro GeoConsulting Limited (Sep 2007 – Jan 2012).

These roles involved **experience in the following areas:**

Geotechnical data acquisition planning and analysis: Planned and acquired geotechnical investigations including onshore/nearshore boreholes, trial pits, offshore downhole sampling and in situ testing in a range of sediment types and deploying a range of sampling and testing tools (WIP sampler, piston sampler, hammer sampler, cone penetrometer, piezoprobe, in situ vane, ball penetrometer and temperature probe).

Data integration and ground models: Experienced in integrating geological understanding of past and active processes with observed surface and sub-surface morphological features and measured geotechnical properties to develop engineering ground models.

Risk Modelling and Value of Information Analysis: Built risk models to represent a site characterisation programme and schedule, including event trees to assess the steps in each programme scenario. Risks and costs associated with decision points and branches are evaluated to determine the balanced risk-cost profile of each data acquisition strategy. This approach provides a transparent and auditable process for the evaluation of the value of information acquisition and ultimately helps justify data acquisition requirements in the context of an overall project risk strategy.

Geohazard risk assessment and probabilistic analysis: Designed Monte Carlo assessments to solve slope stability analyses probabilistically and to derive relationships between deterministic factor of safety and probability of slope failure. Probabilistically considered uncertainties for other geohazard problems, such as pipeline routing. Conducted vulnerability analysis to predict bending stresses, moments and displacements in the event of a geohazard impact, based on provided equipment specifications.

Geospatial analysis: Extensive experience applying novel geospatial analysis techniques to solve geotechnical engineering problems. Developed a GIS method to apply the shear band propagation geomechanical model for slope stability analysis to a geohazard assessment at the ACG field in the Caspian Sea in conjunction with academic experts. Performed pipeline and cable routing analysis using GIS-based least-cost routing algorithms. More novel examples of geospatial analysis experience include the use of GIS to map required foundation depth based on an integrated geotechnical ground model and for a given set of expected loads.

2024 July – 2024 October, Maenggoldo OWF, South Korea (Bada Energy). Export cable routing and constraints analysis, combined using a least cost routing algorithm.

2024 May – 2024 June, TS-69 Platform, Saudi Arabia (Arabian Drilling Company). Geohazard (foundations and shallow drilling) assessment to reconstruct sequence of events leading to well issues, ultimately with the aim of supporting approval for jack-up site visit.

2024 May – 2024 June, Community Shores OWF, USA (COSW). Geotechnical review role for CBRA, sand wave volume screening for cable route clearance planning

2024 May – 2024 June, Absheron Field Development, Azerbaijan (SOCAR). Peer review for geohazard assessment as part of an overall project review to transition from into FEED for new development phase.

2024 Apr – 2024 June, Prefeasibility OWF sites, Sweden (Eolus). Desk study site characterisation and preliminary design brief, foundation feasibility screening.

2024 Mar – 2024 June, Bellrock and Broadshore OWF, UK (Bluefloat / Renantis). Anchor screening study, preliminary sizing and parametric analysis for floating offshore windfarm moorings.

2023 Nov – 2024 June, WLHC OWF, Taiwan (EDFR). Ground model, sediment transport assessment and overall project director for geoscience support contract.

2023 Aug – 2024 June, A07 Oléron OWF (RWE). Desktop study, followed by incrementally more detailed ground models as more data were made available by the French state.

2023 Mar – 2024 June, Confidential OWF Sites, Italy (Acciona Energia). Preliminary ground models for offshore windfarm, offshore and onshore export routes for selected development areas offshore Italy.

2022 Aug – 2024 June, MarramWind OWF (SPR and Shell JV). Support to survey management and laboratory testing programme, preliminary integrated ground model development.

2024 Apr – 2024 May, NDL2 OWF, Germany (Vattenfall). Reviewer to CBRA

2024 Mar – 2024 May, Noirmoutier OWF (Prysmian). Assessment of level of protection against dropped objects provided by rock bags of differing sizes.

2023 Nov – 2024 May, Norfolk Sites, UK (Vattenfall). Shallow ground model update.

2023 Oct – 2024 May, Generic OWF, Japan (Hitz). Geotechnical coordinator for suction pile design approach assessment for fixed structure OWF.

2023 Oct – 2024 May, Stoura OWF, Ireland (ESB). Geotechnical lead for desktop study ground model.

2023 Mar – 2024 May, A06 Mediterranean OWF (RWE). Desktop study, followed by incrementally more detailed ground models as more data were made available by the French state.

2023 Oct – 2024 June, Confidential OWF (DLA Piper). Expert representative to an arbitration case concerning rock protection along part of an offshore cable route, specifically supporting an assessment of the quantum.

2023 Nov – 2024 Feb, El King Field, Egypt (BP). Geohazard assessment of new planned well location

2023 Nov – 2024 Jan, F6/F7 OWF, Taiwan (Synera Renwable Energy). Development of geophysical and geotechnical technical specifications, review of tenderers and recommendation for most applicable contractor.

2023 Apr – 2023 Oct, Tablas Strait OWF, Philippines (GR8-Geo / Shell). Desk study ground model

2023 Apr – 2023 Sep, Vineyard OWF, USA (Prysmian). Determination of stable seabed level elevation through areas of sandwaves along export cable route.

2022 Nov – 2023 Jan, Hai Long OWF (Hai Long Offshore Windfarm Ltd). Sandwave dredging volumes verification study

2022 Jun – 2022 July, MarramWind OWF (SPR and Shell JV) export cable corridor constraints analysis.

2022 Nov – 2022 Dec, Baie de Lion, France (RWE). Desk study ground model development for 3 potential offshore windfarms.

2022 Oct – 2022 Nov, Vung Tau OWF, Vietnam (Sumitomo). Desk study ground model development for the Vung Tau offshore windfarm.

2022 Oct – 2023 Feb, Taichung and Hsinchu OWF (RWE). Coordination and contribution to the ground model team for two offshore windfarms in Taiwan.

2022 Aug – 2023 Mar, MarramWind OWF (SPR and Shell JV). Support to survey management and laboratory testing programme, preliminary integrated ground model development.

2022 Jun – 2022 July, MarramWind OWF (SPR and Shell JV) export cable corridor constraints analysis.

2022 Apr – 2022 May, Baltic Power OWF, Poland (Baltic Power). Shallow ground model development.

2022 Mar – 2022 Apr, Baltic Power OWF, Poland (Baltic Power). Cable burial risk assessment preliminary update.

2022 Mar – 2022 May, Norfolk Vanguard and Boreas offshore windfarm, UK sector, North Sea (Vattenfall). Cable burial risk assessment (x 3).

2022 Jan – 2022 Mar, UK (Confidential). Root cause analysis and spatial landslide risk assessment for Southern North Sea export cable route.

2021 Sep – 2021 Dec, St Nazaire Offshore Windfarm, France (Prysmian). Assessment of rock dumping volume calculations as part of an investigation into a claim for additional rock used by rock installation contractor

2021 Sep – Present, Erebus OWF, Celtic Sea, UK (Blue Gem Wind). Ground model lead and GIS lead to Erebus FEED stage development.

2021 Aug – 2022 Mar, Valorous OWF, Celtic Sea, UK (Blue Gem Wind). Input to pre-FEED studies for Valorous offshore windfarm development.

2021 Jul – 2021 Sep, Södra Midsjöbanken offshore windfarm, Baltic Sea, Sweden (RWE). Preliminary ground model for array area and export cable route.

2021 Jun – 2021 Jul, Formosa 2 development, Taiwan (Formosa 2 Offshore Windfarm). Shallow ground model update following receipt and re-interpretation of additional route-specific shallow geophysical data.

2021 May – 2021 Jun, Thor OWF, Danish North Sea (Iberdrola). Shallow preliminary ground model for the Thor offshore windfarm making use of site-specific geophysical data and reconnaissance geotechnical data to develop shallow soil zonations for cable design.

2021 Jan–2022 Apr, Norfolk Vanguard and Norfolk Boreas offshore wind farms, UK (Vattenfall). Geotechnical interpretive reporting for offshore substation design, including ground model development to inform laboratory and in situ test classification and grouping.

2020 Dec–2021 Sep, Vesterhav Nord and Syd offshore windfarms, Danish North Sea (Vattenfall). Cable Burial Risk Assessment update for inter array and export cables.

2020 Nov–2021 Jun, Vesterhav Nord and Syd offshore windfarms, Danish North Sea (Vattenfall). Geotechnical interpretive reporting for monopile design and installation, including ground model development to inform laboratory and in situ test classification and grouping. Management of advanced monopile design scope of work.

2020 Sep–2022 Sep, Norfolk Vanguard and Norfolk Boreas offshore wind farms, UK (Vattenfall). Ground model soils classification for cyclic test scheduling and interpretive reporting, and cable route geotechnical interpretive report.

2020 Oct–2020 Nov, Baltic Power offshore wind farm, Baltic Sea (PKN Orlen). Preliminary ground model and site investigation strategy determination.

2020 Sep–Nov, Offshore windfarm, CONFIDENTIAL, Eastern Seaboard, USA. Phase 2 ground model development (integration of geotechnical data).

2020 July, Chu Feng offshore wind farm, Taiwan (RWE). Preliminary ground model development (integration of geophysical interpretation, terrain assessment, geotechnical parameterisation, 3D GIS build).

2020 Jun, Caspian Sea (UBOC). Shallow hazard foundation risk assessment for new platform development.

2020 Apr–July, Offshore windfarm, CONFIDENTIAL, Eastern Seaboard, USA. Phase 1 ground model development (integration of geophysical interpretation, terrain assessment, 3D GIS build).

2020 Apr–Dec 2023, Erebus floating offshore windfarm, offshore UK. GIS data management and survey support.

2020 Jan–2020 Mar, Caspian Sea, UBOC. Geotechnical interpretative reporting for offshore platform development (pile foundations, well conductors and shallow-founded infrastructure).

2019 Nov–2020 Jan, Baltic Eagle Offshore Windfarm, (Iberdrola). Ground model development.

2019 Nov, Hai Long offshore windfarm, Taiwan Strait (Offshore Design Engineering). Geotechnical client representative, downhole sample and CPT acquisition, offshore wind farm intermediate geotechnical investigation.

2019 Jun–Oct, Caspian Sea (UBOC). Geotechnical interpretative reporting for offshore platform development (pile foundations, well conductors and shallow-founded infrastructure).

2018 Nov–2018 Dec, Caspian Sea, (UBOC). Offshore Client Representative, Manta seabed CPT and seismic CPT geotechnical acquisition, platform foundation design and earthquake hazard assessment.

2018 Sep–2021 May, Formosa 2, Taiwan. Ground model development, cables ground model development, cable burial risk assessment (CBRA) and cable burial feasibility assessment for offshore wind farm development in geologically complex and seismically active region.

2018 Sep–2019 Jul, Rovuma LNG development, offshore Mozambique (ENI). Geohazard QRA and pipeline burial risk assessment.

2018 Jul–2018 Aug, Caspian Sea (UBOC). Offshore Client Representative, pseudo 3D high resolution survey, mini airgun source, multichannel seismic recorder. Site survey for oil platform development and geohazard assessment.

2018 Feb–Mar, West Nile Delta subsea development, offshore Egypt (BP). Offshore Client Technical Representative for a deep water seabed excavation project, responsible for monitoring the effect of the excavation on surrounding seafloor stability and providing guidance on geotechnical conditions.

2018 Feb–Mar, River embankment relocation project, River Nith, Scotland (Fluidec). Specification of a geotechnical investigation, support to site activities, laboratory test scheduling and parameter reporting.

2017 Dec–2018 Jan, BTC Pipeline Project (BP). Bespoke GIS development for an onshore pipeline GIS database.

2017 Aug –Oct, Viking Link Cable Route, Southern North Sea (Ordtek Limited). Terrain and shallow seabed analysis and GIS database development and curation to support the scoping of a UXO-focussed survey.

2016 Dec–2017 Apr, Hai Long offshore windfarm development, Taiwan (ODE). Provision of a GIS data management plan, development of a geotechnical and environmental GIS database structure to support the future data acquisition and management.

2016 Aug–Dec, Vorlich Field, North Sea (BP). Regional desk study supported by GIS integration of geotechnical and environmental data to assess options for a new site development and export route options.

2016 Jun – Aug, Platina Development, Block 18, Angola (BP). Refinement and update to an existing geotechnical GIS database to incorporate new field layout data and update the integrated ground model.

2016 Mar–2017 Mar, Triton Knoll Windfarm (Triton Knoll Offshore Wind Limited). Provision of geotechnical data management and data visualisation with deliverables in both desktop GIS and webGIS formats.

2015 Sep-2016 Mar, Deepwater Caspian Sea (BP). Statistical review of seismic amplitude response to hard ground near seabed using novel Receiver Operator Characteristics method and development of summary guidance sheets.

2015 May –Jul, Blue Whale Field, Vietnam (ExxonMobil). Development of a regional GIS database to host and integrate reconnaissance level geotechnical and geophysical data.

2015 Feb–Oct, Chirag Deep Gas Project (SOCAR). Development of an integrated ground model supported by a geotechnical GIS ground model.

2014 Nov–2015 Mar, Whirlwind, Lincoln, Strathmore and Typhoon (Hurricane Energy). Geotechnical / Geospatial Lead responsible for the extension of the existing Lancaster GIS to incorporate desk study level data for the connected fields including.

2014 Nov–2015 Feb, Shah Deniz, Caspian Sea (BP). Development of a bespoke GIS data model to host subsea pipeline infrastructure information, including details such as diameter, wall thickness, bending radius, coating, buoyancy, etc,.

2014 May–Sep, Gulf of Mexico (BP). Geospatial Technical Support to a team of Houston-based colleagues constructing an extensive geotechnical GIS database for all offshore site investigation data.

2014 Jan –May, Scarborough Field, North West Shelf, Australia (EMDC). Geospatial Lead for the creation of a geotechnical GIS database for all infield and export route geotechnical data.

2014 Jan–Feb, Azeri field, Caspian Sea (BP). Offshore Client Technical Representative, Lead Shift Engineer and Geotechnical Survey Planner overseeing a geotechnical survey.

2013 Nov– 2014 Jul, Quad 204, West of Shetland (BP). Geotechnical specialist for the geotechnical and geophysical integration of more than 20 years of survey data to build an interpretive GIS-based ground model to support further field development.

2013 Nov–2014 Feb, Lancaster field, West of Shetland (Hurricane Energy). Geotechnical / Geospatial Lead responsible for integrated geotechnical data management and development of a bespoke GIS-based reporting module to support data integration activities.

2013 Sep–2017 Mar, ACG, Caspian Sea (BP). Appraise Field Development Geohazard Assessment (slope stability likelihood and impact specialist analysis, GIS database development and management, drilling hazard review, project manager for Fugro).

2013 Sep – 2014 Oct, Navitus Bay windfarm, UK (Eneco). Geotechnical data management and GIS database development and support to assist the consenting applications for the main site and export cable route associated with the OWF.

2013 Aug–2014 Mar, (PCSB). Geospatial consulting to develop a jack-up suitability GIS database for development areas offshore Malaysia, provision of training via teleconference and in person in Singapore, presentation of present work and future possibilities in the client head office in Malaysia.

2013 Aug–Sep, Kraken field, North Sea (EnQuest). Geotechnical collation and geospatial management of data associated with field development and related export infrastructure.

2013 Jun–2017 May, Offshore Mozambique (ENI). Geospatial data management and specialist slope stability analysis for deepwater developments and export pipelines.

2013 Mar–May, Domino Field, Romania (ExxonMobil). Development of a regional GIS database to host and integrate reconnaissance level geotechnical and geophysical data.

2013 Feb, Neart Na Gaoithe wind farm (Mainstream Renewable Power). Geotechnical and Geospatial Team Leader for the development of a GIS-based 3D integrated wind farm ground model.

2012 Oct–Dec, Tolmount field, North Sea (E.On). Geotechnical collation, SSDM survey data and geospatial management of data associated with field development and related export infrastructure.

2012 Jul–Nov, TEN field, offshore Ghana (Tullow). Geotechnical data collation and data management, integration with reconnaissance seismostratigraphic framework and development of a GIS-based 3D ground model.

2011 Apr–2012 Jan, Hornsea offshore windfarm (SMartWind). 3D geotechnical modelling, visualisation and GIS data management.

2010 Aug–Sep, Norwegian sector, North Sea (Statoil). Site manager on the M/V Bucentaur geotechnical drillship for a range of geotechnical investigations involving simultaneous operations within 500m of existing subsea structures.

2010 Jan–Jun, Middle East to India intercontinental pipeline project (SAGE). Geotechnical and GIS support to a desk study and reconnaissance survey and geotechnical investigation.

2009 Aug–Sep, Clair Ridge, West of Shetland (BP). Lead shift engineer for a geotechnical drilling campaign for platform jacket foundations.

2009 Apr–May, Seastorm 1 windfarm (Northern Energy Seastorm 1 GmBH). Lead shift engineer for a geotechnical site investigation for the foundation development.

2009 Jan–2012 Aug, Angola Deepwater Block 31 and 18 (BP). Geotechnical support and geohazard slope stability analysis, site characterisation, GIS database creation and overall integrated assessment as part of a geohazard assessment team.

2008 Nov–Dec, Norwegian sector, North Sea (Statoil). Lead shift engineer on four geotechnical site investigations.

2008 Jun–2009 Sep, Ringsend WwTW, Dublin Bay (Dublin City Council). Lead Geotechnical Specialist responsible for the development of a GIS-hosted 3D geological model to support the extension of a wastewater effluent outflow.

2008 Mar, Rosebank development, West of Shetland (Chevron). Geotechnical data management and GIS compilation.

2008 Jan–Feb, Norwegian sector, North Sea (Statoil / DNO). Lead shift engineer on three geotechnical site investigations.

2008 Jan–2013 Sep, (Angola Deepwater Geotechnical Consortium). Geospatial data management for all geotechnical data acquired in deepwater Angola (B14, B15, B17, B18, B31, operated by BP, Exxon, Chevron and Total) and development of bespoke tools to facilitate use of the GIS database.

2007 Sep–2020 Sep, West Nile Delta subsea developments, offshore Egypt (BP). Field Development Geohazard Assessment (slope stability likelihood and impact specialist analysis, GIS database management).

full name Terence James Holt

Position Self-employed Marine Environmental Consultant
Nationality British

Asahi House, 10 Church Road, Port Erin, IM9 6AQ, Isle of Man
Tel: +44 (0)1624 834960. Mob: +44(0)7624 414229. Email: tjholt@iom.com

EDUCATION, PROFESSIONAL QUALIFICATIONS & MEMBERSHIPS

Year	Degree	Institute
1980	B.Sc. Hons Marine Biology	University of Liverpool
1984	Ph.D. Seaweed Cultivation	University of Liverpool
2007	JNCC Approved Marine Mammal Observer	Aberdeen

SAFETY CERTIFICATES

ENG 1 Seafarer Medical Certificate	Expires 1 Jan 2026
Offshore Survival: BOSIET (FOET) & Huet	Expires 24 April 2024

PROFESSIONAL HISTORY

June 2016 – July 2017	Niras Consulting Ltd	Technical Director
2003-2016	Centre for Marine and Coastal Studies Ltd (CMACS Ltd)	Founding Director
2000 – 2003	Environmental Research & Consultancy, Uni. of Liverpool	Senior Consultant
1991 – 2000	Port Erin Marine Laboratory, Isle of Man	Consultant & Lecturer
1986 - 1996	Kelp Farm Ltd	Founding Director
1985 – 1986	Nature Conservancy Council	Botanical Surveyor
1984 – 1985	Scarborough Borough Council	Botanical Surveyor

KEY EXPERIENCE

Client representative and Environmental management

Over 35 years of marine environmental survey experience in NE Atlantic, South Atlantic and W Atlantic/Caribbean; I have acted as sole scientist or lead scientist in teams of surveyors operating grabs, cameras, trawls, water samplers, ctd and acoustic survey on large & small scale surveys (inshore & offshore) regularly since 1996 in the Irish Sea North Sea and NE Atlantic in UK & Ireland, including preserving of various samples. Familiar with ad-hoc interpretation of various acoustic datasets to design or adapt ground-truthing during surveys. Some experience of UHR and HR seismic survey, SBP survey; geotechnical including coring; Environmental DNA sampling for water and sediments.

Client representative/Environmental QC/ Environmental management experience includes:

- Five months Environmental manager for Oxagon stage 1 project, North west Saudi Arabia (see project summary below)
- 11 days environmental surveys investigating possible impacts of a small oil spill from an Irish Sea pipeline for ENI.
- 47 days EBS QC/ permitting of grab and camera surveys covering numerous Liverpool Bay assets and adjacent areas (Hynet CCS scheme involving planned decommissioning, partial decommissioning and installation of CCS related assets) for ENI.

- 37 days EBS QC/ permitting at Marigold/Sunflower Northern North sea Aug-Sep 2022 on a complex series of surveys involving grab and camera baselines for potential well developments and pipeline tie backs; wellhead inspections; analogue (sparker, pinger, magnetometer, sidescan and mbes) survey.
- 10 days for Neo/Perenco/RPS at "Christian Bligh" overseeing final runs and re-runs for a geophysical survey involving SBP, UHR and HR as well as analogue surveys; followed by camera and grab surveys, N. North Sea, for EBS and habitat mapping.
- 78 days environmental core survey using mainly Geobore & vibrocore (some grab sampling and water sampling and geotechnical field logging) for core analysis in support of a dredging license for HPC / EDF for Hinkley Point C nuclear power station development, Aug – Nov 2020. Subsamples collected from core samples for storage and subsequent analysis of chemical and physical determinands, radionuclides and particle size determination. Additional project familiarisation /preparation of methods in July – Aug 2020.
- 37 days EBS QC wrt stills and video camera, box core and ctd / water sampling and profiling for EXXON Hammerhead development off Guyana 20 April – 26 May 2019; including ad-hoc additional work developed mid-survey aimed at ground truthing possible reefs/hard ground and possible gas seeps, some of which was related to investigation of a possible pipeline route to shore. Up to 3300m depth.
- 11 days EBS QC for TEP; included extensive and detailed benthic grab and camera surveys of potential sponge beds in circa 700m of waters within the Faeroe-Shetland Channel Marine Protected Area in very challenging sea conditions Oct 2018, TEP Ltd.
- 18 days EBS QC for benthic grab and camera, and water column sampling and ctd surveys, including eDNA (sediments and water) in 1500-3000m of water off Guyana in relation to two separate EBS surveys for different developments, S America Sept 2018.
    - EXXON Lisa EBS and
    - Canje site survey,
- 1 month EBS QC for a large scale groundtruthing survey (grabs and cameras) based on ongoing interpretation of multibeam and sidescan information (Irish sea, Centrica and Dong Energy); special attention paid to potential for identification of possible biogenic geogenic or chemosynthetic reefs. Irish sea Round 3 OWF Zone, 2010.
- 10 days EBS QC / party chief on a 10 day pipeline route survey in the Corrib gas field N Atlantic off Ireland; day grab sampling for contaminants, fauna and sediment psa analysis, and S.P.I. (ground penetrating) cameras (Shell); 2007.

Environmental Assessment and interpretation	Marine ecological impact, appropriate and strategic assessments for many major projects. Team member for plan-level HRA assessments for Crown estate round 4 project (2021) and FLOW (floating offshore wind, Celtic Seas) 2022; lead technical role in benthic ecology section of Irish Offshore Oil & Gas SEA in 2014 & Member of the expert team responsible for the UK Offshore Energy SEA in 2009. Expertise in renewable energy (wind, wave and tidal). Experienced in relation to oil & gas projects (since 1994), and coastal infrastructure projects such as electricity interconnectors, telecoms cables, ports/marinas, discharges and sea defences. Highly experienced in assignment of subtidal and intertidal biotopes, including supporting statistical analysis. Also experienced in assessment of water and sediment quality against guidelines. Experienced at high level reviews of draft survey reports, scoping studies etc.
Survey &	Knowledge of a wide range of groups, notably benthic invertebrates, fish, and marine

Monitoring	mammals, and survey techniques. Have prepared and run a course on underwater camera survey techniques, including in relation to acoustic survey data, for Natural England (NW region). Highly experienced in both field work and reporting. Prepared numerous reports for monitoring programmes including final reports for long term benthic monitoring programmes (up to seventeen years) for North Hoyle, Gwynt y Mor and Greater Gabbard offshore wind farms. Have acted as party chief / lead scientist and client representative on offshore survey programmes. Highly experienced at intertidal survey techniques on both sediment and, especially, rocky shores. Primarily UK and Ireland but also some experience in Kattegat, Mediterranean, Red Sea, Sub-Arctic and S America.
Protected Species and Habitats Work	Expertise in relation to protected marine and coastal habitats and species including Annex I features since 1990s. Preparation of reports for UK Conservation Agencies on the sensitivities of specific marine communities to human activities; drafting of biodiversity action plans for UK and Isle of Man, and production of numerous summaries of marine biological information for specific geographical areas. Invited participant at workshop to develop criteria for assessing reefiness of *Modiolus modiolus* communities. Knowledge of many Annex I habitats notably blue mussels *Mytilus edulis*, *Sabellaria spinulosa*, *Sabellaria alveolata*, *Modiolus modiolus*. Also experienced with protected/vulnerable species eg pink sea fans, corals, seagrass.
Marine Fisheries including Fisheries Auditing	Involved in numerous assessments of fisheries to the Marine Stewardship Council standards for sustainable and well managed fisheries. Involved in full MSC assessments, annual audits, peer reviews and pre-audit advice of mollusc and finfish fisheries in **UK**, **Denmark**, Isle of Man, Holland, **Faeroes, Canadian** & USA Atlantic Coast, **Gulf of St Lawrence, the sub- Antarctic, Greenland,** Bering sea **& Vietnam**. (In-country experience in bold). Managed surveys from commercial fishing vessels to determine effects of pipeline and cable laying on commercial stocks of whelks, scallops, crabs and lobsters; experience of fish and bycatch surveys using lobster and whelk pots, commercial otter trawls, scallop and queen scallop dredge fisheries, towed camera and divers. Have used sidescan sonar to collect evidence of illegal dredging that was used to support a successful prosecution. Have installed mussel cultivation systems into disused docks, and acted as expert assessor in a public enquiry re effects of marine development on mussel lays.
Cultivation and commercial use of seaweeds (1980 – 1996)	Phd in seaweed cultivation, pilot scale studies of cultivation in Scotland, Ireland and Isle of Man, followed by several years as director of a commercial seaweed farming company selling seaweeds for food in UK. I have also consulted on seaweed cultivation and harvesting in Morocco, Madagascar, Maldives, Oman, Kiribati, Mozambique and Ireland with additional experience in Philippines, United States and S. Korea. Trained for assessment of seaweed suppliers against MSC/ASC sustainability standards.
Other	Regular reviewer for bids to Cefas for grants from Seafood innovation Fund (2020-2023; total 47 bids reviewed.

PROJECT EXPERIENCE

The following are representative examples from a limited number of projects.

Boskalis, Oxagon stage 1 - Environmental Manager August 2023 – December 2023
Responsible for management of the environmental team monitoring and advising client (NEOM) in respect of stage 1 of NEOM port expansion; (installation and maintenance of a suite of 24 hour monitoring buoys transmitting and recording live data on suspended sediment and a variety of other water quality parameters; key role in turbidity management group for the project; management of baseline surveys and

daily/weekly/monthly monitoring surveys monitoring surveys for in situ water quality, sediment quality, coral reef and fish status and underwater noise; marine mammal and turtle surveys; coral and seagrass surveys and liaison with coral translocation group from KAUST; checking of maintenance and positioning of silt curtains; survey and monitoring of terrestrial ecology including wadi trees and associated vegetation; reptile bat and bird surveys; soil surveys and monitoring, archaeological walkovers, contaminated land remediation in co-operation with specialist remediation team; monitoring of PM10 and PM25 dust levels, other construction related potential terrestrial pollutants including exhaust related chemicals, light, noise; groundwater borehole monitoring; upkeep of ad-hoc wildlife observation register; responsible for managing tree translocation projects; weekly meetings and ad-hoc liaison with client (NEOM); environmental training and project inductions for all project staff.

GGOWL Ltd; Gabbard Offshore Wind Farm monitoring programme. 2005 - 2023
Recently took part in final (year 5 post – development survey) sediment and benthos grab and camera survey. Some involvement in survey preparation and planning; prepared final monitoring report including all statistical analysis for pre- and post-development surveys. Wase been involved in many aspects of the EIA survey and monitoring for this wind farm for over 17 years.

ENI Liverpool Bay Assets October-November 2022 and April 2023.
47 days EBS QC/ permitting of grab and camera surveys covering numerous Liverpool Bay hydrocarbon assets and adjacent areas and the Hynet CCS scheme; involving planned decommissioning, partial decommissioning and installation of CCS related assets); from a small inshore day vessel;
And;
Monitoring study on pipeline event (sediment and faunal sampling and camera work) spring 2022; from a small inshore day vessel.

Vysus Group & Hibiscus petroleum/Marigold and Sunflower developments August Sept 2022
Was client representative overseeing a complex series of surveys involving grab and camera baselines for potential well developments and pipeline tie backs; wellhead inspections; analogue (sparker, pinger, magnetometer, sidescan and mbes) survey. Responsible for permitting for entry/survey into a production facility 500m exclusion zone. Involved in survey planning during the workand in liaising/checking of MMo permit applications.

NEO/Perenco Christian Bligh July 2022
Was client representative overseeing final runs and re-runs for a geophysical survey involving SBP, UHR and HR as well as analogue surveys; followed by camera and grab surveys, N. North Sea, for EBS and habitat mapping.

Fugro Searcher Sweden Kattegatt SYD wind farm
Benthic scientist on board this EA related benthic survey; involved with sample site selection after on-board review of multibeam and sidescan but also heavily limited by magnetometer survey due to potential for UXO. Double Van Veen grabs for contaminant, psa and fauna analysis; gravity core sampling for deep contaminant analysis; camera survey.

Grace Hopper cable project Dec 202 – July 2021
Review of existing cable route survey data; review of available methods for transplantation of Pink Sea Fans (PSFs); design and oversight of dedicated survey to quantify and minimise potential impacts of Google's Grace Hopper cable on protected species (Pink Sea Fan).

Scotwind bid; confidential Dec 2020-Jan 2021
Subcontracted for high level screening work in relation to a Scotwind Offshore wind bid; responsibility for reviewing sensitivities of all Scotwind bid areas in relation to birds, benthos, fish, commercial fisheries, marine mammals, archaeology and seascape, with input also for defence issues.

ICENI and Mercator routes for BT cable 2020 - 2022

Review and updating of drafted EIA chapters with regard to changes to project including timing and addition of likely sandwave removal; follow up work addressing impacts on fisheries in French sector. Also took part in surveys January 2022 to finalise maps of Sabellaria reefs and sandwave areas.

EDF / HPC Ltd - Hinkley Point "C" Nuclear Power Station July, Nov 2020
Almost three months of environmental client representative work on sediment coring campaign in support of a dredge license application for Hinkley point "C" nuclear power station development. CR work was carried out over two campaigns, plus additional support before and during the survey work (liaison with interim client representatives and preparatory work including contributing to method statements). Subsamples were taken from geobor and vibrocore samples for subsequent analysis for chemical contaminants, radionuclides and particle size determination, with more limited grab and water sampling. Survey was carried out from the Jack up barge Fugro Excalibur.

Crogga Ltd - Crogga gas field, 2019-2020
Drafting of environmental scopes in relation to a long term programme of gas exploration in the Irish Sea; ongoing; ad hoc advice re environmental issues including preparation of survey specifications, contributing to tender evaluation and contract award, and anticipated management of surveys in coming years.

ExxonMobil – Esso Exploration & Production Guyana Hammerhead development, April-May 2019)
Client representative for Environmental Baseline Surveys for hydrocarbons in 100 – 2000m deep waters off Guyana. Involved supervision of benthic grab and camera work for both EBS of the production area and a potential gas pipeline to shore survey aboard Fugro Brasilis.

Faeroe-Shetland Channel Marine Protected Area oil and gas exploration - Total Exploration and Production Ltd, October 2018)
Client representative for TEP Ltd, supervising extensive and detailed benthic grab and camera surveys of potential sponge beds in circa 700m of waters within the Faeroe-Shetland Channel Marine Protected Area, involving client meetings pre and post survey, regular contact with client environmental managers during survey. Project involved innovative methods of obtaining grab samples via ROV in extremely challenging sea conditions aboard Stril-Explorer, MMT.

ExxonMobil – Esso Exploration & Production Guyana, September 2018)
Client representative for Environmental Baseline Surveys for hydrocarbons in 1500-3000m deep waters off Guyana. Involved supervision of benthic grab and camera work and water column sampling and ctd survey aboard MV Sable, Chouest. Stabroek, Kaiteur and Canje blocks, primarily on Lisa wellhead.

Gwynt y Môr Offshore Wind Farm (Npower - RWE – GyM OW Ltd, 2003-2021)
Lead on large program of benthic surveys and assessments for the EIA (including noise issues especially re spawning fish). Included survey design, liaison and sign off with authorities, and project management. Post-consent development of monitoring methods for FEPA Licence compliance (lead on benthic ecology, also involved with fish surveys. Subsequently involved with re-designing post-development survey; prepared final benthic monitoring report covering the whole survey period.

Rhyl Flats Offshore Wind Farm (Npower – RWE - Rhyl Flats OW Ltd, 2005-2016)
Survey design, data analysis and report preparation for fish and benthic ecology monitoring for the whole monitoring period 2005-2011, including preparation of final benthic monitoring report. Was project manager for some periods. Prepared a report on colonisation of turbine monopiles and scour protection.

Rhiannon OWF (Celtic Array 2012-2014)
Lead for drafting of EIA chapters; responsible for drafting benthic ecology chapter and involved in drafting fish ecology chapter for EIA. Included contributions to survey design using existing broadscale survey data from Irish Sea Round 3 OWF surveys (see below). Extensive liaison with NRW in respect of Annex I habitats, especially horse mussel *Modiolus* reefs.

Irish Sea Round 3 OWF Centrica (2011-2012)
Was client representative to ensure high quality survey data was obtained during month-long seabed surveys of the Irish Sea round 3 offshore wind farm zone using grabs and camera and interpretation of sidescan and backscatter data, on board a ship with a crew of 21. Reviewed report of above survey. Prepared a ZAP (Zonal Appraisal and Planning) Assessment report on fish and benthos for this area, which involved taking part in ZAP meetings with a large number of other consultants and stakeholders.

Proposed SACs NE Irish sea (Natural England 2013-2014)
Support role, including some interpretation of images, in camera surveys to determine status of possible conservation features in three areas of subtidal reef. Prepared and ran a one day workshop on camera survey for Natural England Irish Sea Team and other invited attendees as a subsequent contract, primarily in order to allow NE staff with a greater understanding of capabilities and limitations of camera surveys.

North Hoyle Offshore Wind Farm (Npower, 2000-2007)
Heavily involved for circa eight years from scoping studies through EIA including survey design, implementation and reporting.
This included management of a five year monitoring programme and post - monitoring review; including survey design, management, implementation and analysis/reporting; primarily responsible for infauna, epibenthos and fish. Contributed to a workshop that CMACS organised in order to present findings of the monitoring programme and review.

Ronaldsway Airport Runway Extension Works (Isle of Man Government Department of Transport, 2007-2013)
Contributed to Environmental Impact Assessment and baseline surveys for monitoring purposes for intertidal and subtidal benthos in relation to Ronaldsway airport runway extension; plus repeat surveys following development. Planned, carried out and reported on all intertidal phase I & quadrat surveys, and sublittoral grab surveys; planned, interpreted and reported diving video surveys, pole (including scallop counts), & quadrat surveys. Included interpretation of possible impacts from the development.

UK Offshore Energy SEA (Hartley Anderson for BERR, now DECC, 2008-09)
I was one of two CMACS members of expert team responsible for delivering the Strategic Environmental Assessment (OESEA: including Round 3 wind, seaward rounds of oil and gas licencing and gas storage in depleted offshore fields) to the UK Government (Department of Energy and Climate Change). Contributed at two day workshop sessions and reviewed all draft chapters.

Corrib Gas Field surveys, Ireland (RSK Ltd/Shell, 2007)
Survey manager (party chief) on a ten day baseline benthic environmental survey; managing two survey teams (day and night shifts) on 24 hour ops utilising Day Grab /Hamon grab / SPI camera / water sampler. Although RSK were project managing the survey, OSIRIS Surveys, Benthic Solutions and Bangor university (vessel supplier) were also involved.

London Array OWF (PowerGen/Shell/E.ON – (London Array Limited 2003-2005)
Managed a large programme of Intertidal and Offshore Surveys and Environmental Impact Assessment for the world's then largest proposed offshore wind farm development (intertidal & offshore benthos & sediments; offshore fish; including additional responsibility for assessment of noise and EMF effects).

Ramboll ltd (SSE) 2016-17
Drafting benthic and commercial fisheries chapters for Environmental report on Shetland – Caithness HVDC cable. Also carried out intertidal survey in respect of cable landfall for this project.

Signed 

Terence James Holt 4/1/2024

Rachel Crabtree

Principal Consultant: Environment and Consents
London, UK

Rachel has worked as a Principal Consultant at OWC since 2024. With a background in marine ecology, Rachel is experienced in undertaking Environmental Impact Assessments (EIA) of marine developments. She has experience working with a variety of clients representing a range of seabed development sectors such as offshore wind farms; offshore transmission owners (OFTOs); interconnector cabling; wave and tidal energy; marine aggregates; and statutory nature conservation agencies. Rachel has worked on projects in the UK, Ireland and internationally.

Qualifications

MRes Marine Biology – University of Plymouth
BSc (Hons) Marine and Freshwater Biology – University of Wales – Aberystwyth

Experience

Principal Consultant, Environment and Consents, OWC (2024 – Present). Rachel joined OWC in 2024 as part of the Environment and Consents Team, which supplements existing services offered by OWC, supporting clients through the consenting process and managing the EIA and consent interface between developers, consultants and OWC.

Senior Consultant, ERM (2022-2024). Worked as a Project Manager across a variety of sectors, focusing on OWF and OFTO. Provided support to clients throughout the project life cycle, particularly in EIA, post-consent compliance, and operations and maintenance.

Senior Consultant, MarineSpace (2019-2022). Worked as a Project Manager across a variety of sectors, focusing on OWF and OFTO. Provided support to clients throughout the project life cycle, particularly in EIA, post-consent compliance, and operations and maintenance.

External Consultant, Environment and Consents, Ørsted (2019-2022). Secondment within the Operations and Maintenance team providing consent compliance support for the full portfolio of Ørsted's operational OWFs within the UK. Engagement and liaison with the Marine Management Organisation (MMO) to discharge licence conditions. Supported on consenting for unforeseen and reactionary works.

Referrals Analyst, Tseil Waututh Nation, Vancouver, Canada (2018). Reviewed EIA referrals for development projects within British Columbia as part of the EIA consultation process in Canada. Assessed potential impacts that proposed development projects and policy changes may have on Tsleil-Waututh's Indigenous rights, title, and interests. Represented Tsleil-Waututh on project files and built relationships with external agencies and developers.

Consultant, MarineSpace (2013-2018). Consultant within the Ecology Team. Production of EIA chapters for a range of offshore sectors including aggregates, and wave and tidal developments. Production of documents such as Supporting Information Documents, Annual Monitoring Reports, Environmental Appraisals, and Fisheries Liaison Plans. Management of environmental and consent support for OFTOs.

Project References

2025, SELC, Export Cable Environmental Review (USA). Environmental lead on a review of environmental constraints and impacts for export cable installation, and mitigation methods that have been used at past projects. Review of how project learnings could be implemented at offshore wind farm export cable routes in the USA.

2025, Confidential Client, Neart Na Gaoithe OFTO (UK). Project manager for due diligence input for the Neart Na Gaoithe export cable including a review of surveys required for consent compliance, asset management surveys, and input to a cost model for the lifetime of the OFTO asset.

2024-2025, Confidential Client, OWF Site Selection Constraints Analysis (DE). Ecology lead on review of environmental constraints for PDAs in Germany to inform heat mapping and final site selection.

2024, Confidential Client, OWF Site Selection Constraints Analysis (PT). Ecology lead on review of environmental constraints for PDAs in Portugal to inform heat mapping and final site selection.

2024, Confidential Client, Round 5 Bidding Support (UK) Project manager for support on Social Value documents. Production of EIA timeline, input into EIA strategy document, and environmental review of export cable routes.

2023 – 2024, Dogger Bank A, B, C Cable Installation, (UK). Project Manager for post-consent support during the export cable installation phase for three OWFs.

2024, Seagreen Offshore Wind Farm, (UK). Project Manager for post-consent environmental support for S36 Licence Variation for the Seagreen OWF in Scotland. Production of Supporting Information Document for submission to MD-LOT.

2023-2024, XLinks UK to Morocco Power Project, (UK, Europe). Project Manager for geophysical and environmental survey consenting support across the UK, France, Spain, Portugal and Morocco for 2023 and 2024 surveys.

2023-2024 Aldbrough Hydrogen Storage Project, (UK). Offshore team lead for the marine components of the project including management of marine surveys and of the PEIR chapter production.

2022-2024, Kyle Rhea Overhead Cable Project, (UK). Project Manager for marine licence application for replacement of overhead cables in the Kyle Rhea Strait. Management of subcontractors for marine surveys.

2019 – 2024, Confidential Clients, Environmental and Consenting Technical Due Diligence, (UK). Management and coordination of TDD for confidential clients identifying and quantifying environmental and consenting risks for lenders and bidders for both OWF and OFTO clients.

2022 – 2023, Shelmalere Offshore Wind, (IR). Assistant Project Manager for the up to 1GW proposed Shelmalere offshore wind farm project located off the coast of Wicklow and Wexford in Ireland. Production of offshore components of EIAR Scoping Report, and specific technical EIAR scoping consultation with key consultees.

2023, Celtic Array Offshore Wind, (IR). Assistant Project Manager for the up to 1GW proposed Celtic Array offshore wind farm project located off southeast coast of Ireland. Production of offshore components of EIAR Scoping Report, and management of subcontractors.

2023, Confidential Client, (IR). Assistant Project Manager for the up to 1GW proposed offshore wind farm project located off southeast coast of Ireland. Production of offshore components of EIAR Scoping Report, and management of subcontractors.

2022, Unnamed, Confidential, (UK). PM for a confidential client in the Celtic Sea delivering consent support including site refinement and constraint analysis; and consenting and permitting support.

2019, Greenlink Interconnector, (UK). Production of herring and sandeel assessment for the interconnector route.

2019-2022, Ørsted Secondment, (UK). Three-year secondment working full time for Ørsted within the Environment and Consents department, specifically within the Operations and Maintenance team.

2017, Strangford Lough Tidal Device Decommissioning, (UK). Production of EIA for the decommissioning of a tidal turbine device within Strangford Lough. Including stakeholder engagement and liaison with DAERA in Northern Ireland.

2015-2017, O&M Support OFTO Clients, (UK). Project management for a portfolio of OFO clients providing environmental and consenting support during the operational phase. OFTO projects were for a number of clients and included the following sites: Gwynt y Môr; Race Bank; London Array; Lincs; LID; Humber Gateway; Greater Gabbard; and Burbo Bank.

Corentin Chaptal

Geologist – 3D Ground Modeller
Oxford, UK

A petroleum geologist by training with three years of experience in the geophysics industry. Skilled in field surveys, data interpretation, analysis and reporting, client communication, 3D modelling, GIS, and data management. Participated in international field surveys ranging from one week to several months, as well as academic conferences in the Oil & Gas sector.

Joined OWC with a focus on offshore wind farm projects, where he has strengthened his expertise in GIS—particularly ground modelling—alongside data management, interpretation, and reporting, including the creation of charts and figures to support project delivery.

Key strengths include adaptability, attention to detail, and a strong commitment to meeting client expectations through open communication. He relies on these qualities to integrate smoothly and contribute effectively as a new member of the OWC team.

French citizen living in the United Kingdom, native French speaker, and fluent English speaker.

Qualifications

MSc and BSc in Petroleum Geoscience (UniLaSalle, Beauvais, France)

BSc in Engineering Sciences (ENSE3, Grenoble, France)

Foundation Degree in Mathematics and Physics (Lycée Faidherbe, Lille, France)

Experience

Geologist – 3D Ground Modeller, East Point Geo (OWC), (May 2025 – Present).

- Contributing and delivering various renewable energy projects through the development of GIS-based 3D ground models as part of onshore/offshore site characterisation.
- Collating, interpreting and presenting various geoscience datasets in a GIS 2D and 3D environment.
- Use of sound geological principles and conceptual understanding to assemble, analyse and troubleshot 3D geological models in a GIS environment
- Workflow improvement and documentation

Geoscientist – Project delivery specialist, Zetica Limited (Aug 2021 – Apr 2025).

- Office work: Geophysical and geological project specialist for pre-maintenance rail network assessments, in charge of bidding; Ground Penetrating Radar (GPR) and LiDAR data acquisition, processing and interpretation; and client delivery.
- Fieldwork: Field operation coordinator in the UK, France, and the UAE.
- Special work: GIS, drone and photogrammetry projects.

PhD student, University of Aberdeen (Feb 2020 – Apr 2021).

- Virtual outcrop studies of structural geometries for reservoir performance.
- Drone data acquisition and fieldwork in the French Alps and Merseyside.
- Developed workflows for modelling complex 3D outcrops.
- Modelling/interpretation of 3D outcrops to fill the SafariDB Geological Outcrop database.

Junior Geologist, UniLaSalle, France & GNS Science, New Zealand (Jan 2019 – Dec 2019).

- Geological modelling of gravity-driven deposits along the Hikurangi Margin.
- 40-day coastal fieldwork with drone surveying and 3D outcrop modelling for structural analysis, sedimentological measurements, and 3D modelling.
- Workflow creation for 3D outcrop model development and interpretation.

- Oral presentations and publications at 2019 IAS, EAGE and ASF conferences.

Project references

2025, AO9 Floating Offshore Wind Farm (FR) – OWF Ground Model. Development of the GIS ground model to support the preliminary study of the AO9 extension site. Dataset review and data management. Desktop study and ground modelling. Creation of figures and charts. Reporting and addressing client review comments.

2025, Rampion 2 Offshore Wind Farm (UK) – Landfall Ground Model. Ground model development and reporting. Integration of newly surveyed geophysical and geotechnical data (4 boreholes, 2 trial pits and 4 onshore geophysical lines) for ground modelling purpose. Drawing of geological cross-section profiles throughout the landfall site to characterise the depth of interest for Horizontal Directional Drilling (HDD). Illustrating and detailing the site through the writing of a technical note, the creation of maps and vectorised cross-sections and a GIS project.

2025, Outer Dowsing Offshore Wind Farm – 3D model and Charts (UK). Creation of charts following the update of horizons within the OSS, ORCP and ANS areas. 3D model of the Export Cable Corridor.

2025, West of Orkney Offshore Wind Farm – GIS Ground model, 3D models and Charts (UK). Ground model development of the OAA and ECC area phase 2 study. 3D modelling of the OAA and ECC sites. Creation of charts and figures to update the phase 2 report.

Publications and presentations

Improved 3D coastal outcrop models using multiple Unmanned Aerial Vehicle acquisitions (journal publication and presentation at the First EAGE Unmanned Aerial Vehicle Workshop, Toulouse, France, Dec 2019; https://doi.org/10.3997/2214-4609.201903327)

3D coastal outcrop modelling workflows for deep-water system characterisation (oral presentations at IAS Roma, Italy, Sep 2019 and ASF Beauvais, France, Oct 2019)

Isla Symons

Environment and Consents Intern
South West England, UK

Isla is a Graduate Marine Consultant with OWC working within the Environment and Consents team. She has an educational background in both hydrographic surveying and offshore renewable energy and studied a range of topics including renewable energy law and policy, marine economics, marine biodiversity and data processing in a variety of different programmes, including a focus on port and dredging activities. Isla has also had practical experience mobilising and using survey equipment such as MBES, SSS, SBP and more. She has previously worked within business development in subsea surveying, worked with potential clients on service offerings, developed market strategy platforms and assisted wider commercial functions on tenders. Isla is now supporting the Environment and Consents team at OWC, assisting on projects throughout the project lifecycle including Pre-FEED, post consent compliance and marine licencing projects. She is also collaborating and working with other departments, assisting on a wide range of projects.

Isla is a British citizen and a native English speaker.

Qualifications

MSc Offshore Renewable Energy, University of Plymouth (2023)

BSc Ocean Exploration and Surveying, University of Plymouth (2022)

Experience

Graduate Marine Consultant, OWC, (Sept 2025 – Present). Isla supports the Environment and Consents Team in delivering environmental permitting and advisory services for renewable energy projects. This involves preparing marine consents and compliance documentation across all project phases and producing client-facing deliverables such as reports and presentations. She also collaborates with other technical teams and contributing to environmental analysis, proposals, and business development.

Environment and Consents Intern, OWC, (Jun 2025 – Aug 2025). Isla joined OWC in 2025 as part of the Environment and Consents Team, and supports existing services offered by OWC, including early feasibility, survey support, environmental impact assessment (EIA) interface and post-consent compliance.

Business Development Intern, Reach Subsea, (Jul 2024 – Oct 2024). Experience focussed on the commercial department and assisted the Business Development Manager in creating a market strategy. Studied and analysed changes in the energy industry to apply to the market strategy. Strategy development includes CRM interface enhancements and sales pursuit plans to. Produced an internal platform for easy understanding of the strategy, created from Microsoft Office packages including MS Excel, PowerBI and Power Pages. Supported the wider commercial team on tenders.

Project References

2025, Confidential Client, Vessel Study, (UK, Europe). Review of relevant laws and legislations for the use of certain vessels in European waters. Consideration of maritime law and permits needed for geophysical surveys.

2025, Confidential Client, Survey Consent Support, (UK). Completion of applications and exemption forms for relevant licences for geophysical and geotechnical surveys.

2025, Confidential Client, Survey Management, (PNG). Input involved research to understand legislation in Papua New Guinea, the specification of any previous surveys in the country, Papua New Guinea environmental legislation and subsequent designations as well as international standards (both for survey and general IFC standards for EIA and environmental assessments).

2025, Confidential Client, Environmental Constraints Analysis, (Asia). Research into marine protected areas and environmental/social factors. Input on baseline information and RAG rating for proposed sites.

2025, Confidential Client, Stakeholder Analysis, (GR). Contributing author to a stakeholder engagement plan, including stakeholder analysis.

Appendix H Intertidal Benthic Survey Methodology

H.1 Intertidal Phase I survey

An intertidal Phase I walkover survey will be completed in 2026 to map the distribution of biotopes and species present, in line with standard JNCC intertidal survey guidelines (Davies *et al.*, 2001) and common standards monitoring guidance (JNCC, 2004).

The surveys will involve a full visual assessment and UAV surveys of the intertidal area to characterise the habitats and species present. The visual assessment will be completed on foot, walking across the available intertidal area.

Location coordinates will be taken at habitat transition points to ensure habitat boundaries are accurately represented on the habitat maps produced. In addition to the full habitat walkover, several transects, between the MHWS and mean low water springs (MLWS), will be surveyed. Biotope assessments will take place in the upper, middle and lower shore sections of each transect by qualitatively assessing the habitat type and species present. The number and location of transects will be decided *in situ* based on habitat heterogeneity to ensure the full range of habitats present within the study area are accurately represented. Information recorded will include, but not be limited to:

- General site conditions;
- Sediment type and characteristics (including visual estimation of Folk sediment classification);
- Topography;
- Biotope distribution;
- Epifaunal species presence and abundance;
- Any anthropogenic pressures observed on site (e.g. bait digging or other disturbance).

The presence and distribution of species or any features of conservation interest will also be recorded where encountered. Biotopes will be allocated according to the EUNIS (EEA, 2021) whilst in the field, in line with EUNIS habitat classification guidance (Parry, 2019) (unless further office-based research is required to allocate a specific biotope). The presence of any INNS will also be noted and their location recorded. Photos of all habitats and species within the survey area will be taken along with coordinates to enable cross-referencing to habitat maps.

H.2 Intertidal Phase II survey

Quantitative Phase II sediment sampling will be completed to collect samples for the identification of macroinvertebrate assemblages and sediment characteristics present within the survey area. Sediment characteristics also provide a valuable insight into the benthic characteristics of an area and associated macroinvertebrate biota that would typically be expected to occur. Macroinvertebrates are important indicators of overall ecological health because they closely reflect ambient environmental conditions and respond rapidly to contamination events.

The indicative Phase II survey area will be the same as the Phase I survey area, as shown in **Sheet 3** of **Figure** 3-1. Sampling will be carried out in accordance with the JNCC Marine Monitoring guidance (Davies *et al.*, 2001) at survey stations distributed across the intertidal zone.

Ten stations are to be sampled across the survey area at the landfall location. All will undergo PSA and macroinvertebrate analysis, and three stations will also be sampled for chemistry analysis.

The precise locations of the sample stations will be determined during the intertidal Phase I survey, to be completed before the Phase II sampling, to ensure sampling targets the full range of habitats present.

At each survey station the following will be taken:

- Single 0.01m^2 faunal cores inserted into the sediment to a depth of 15cm and removed before being sieved through 0.5 millimetre (mm) mesh and preserved in a suitably sized container for later faunal analysis;
- Single sediment sub-sample for PSA is removed with a 0.01m^2 sediment core.

Faunal samples taken will be preserved in a 4% buffered formalin solution following safe working procedures outlined in safe working plans that will be produced before the surveys commence. The samples will then be delivered to an approved laboratory for analysis.

Sediment characteristics that will be measured include:

- PSA (laboratory analysis post sample collection);
- Macroinvertebrate fauna identification and counts;
- Sediment chemistry analysis.

Faunal analysis involves the counting and identification of macroinvertebrates to the lowest taxonomic level possible. Major faunal group biomass will also be determined, which is particularly useful to identify faunal communities that may be representative of disturbed conditions, such as areas subject to increased concentration of nutrients, amongst others. Species nomenclature will follow the World Register of Marine Species (WoRMS) (WoRMS, 2025) except where more recent revisions are known to supersede WoRMS. All samples will be analysed by an approved laboratory that participates in the NMBAQC (North Atlantic Marine Biological Analytical Quality Control) scheme.

Appendix I 2023 and 2024 survey sample locations

9.1.1.1 **Table 9.1** details the relevant sample stations located within the MHPGC Project PEIR Red Line Boundary, with these are illustrated in **Figure** 3-1**.**

Table 9.1: Subtidal benthic sample locations within the MHPGC Project PEIR Red Line Boundary

Appendix J Species scientific common names and biotopes

J.1 Latin and common names

Scientific name	Common name
Abra alba	White furrow shell
Abra prismatica	Elongated furrow shell
Acrocnida brachiate	Sand burrowing brittlestar
Alcyonidium diaphanum	Sea chervil
Alcyonium digitatum	Dead mans fingers
Amphiura filiformis	Brittlestar
Arachnanthus sarsi	Scarce tube-dwelling anemone
Arctica islandica	Ocean quahog
Ascidella scabra	Sea squirt
Astropecten irregularis	Sand star
Bathyporeia elegans	Sand digger shrimp
Corella eumyota	Orange-tipped sea squirt
Echinocyamus pusillus	Pea urchin
Ennucula tenuis	Smooth nut clam
Fabulina fabula	Bean-like tellin
Galathea intermedia	Squat lobster
Galathowenia oculata	Oweniid tube worm
Heteromastus filifirmis	Red thread worm
Hydroides norvegica	Norweigan tube worm
Kurtiella bidentata	Two-toothed montagu shell
Laminaria digitata	Oarweed
Laminaria hyperborea	Tangle/Cuvie
Levinsenia gracilis	Paraonid bristle worm
Ligia asellus	Sea slater
Magelona mirabilis	Shovelhead worm
Mediomastus fragilis	Capitellid bristle worm
Modiolus modiolus	Horse mussel
Nephtys hombergii	Catworm
Nucula nitidosa	Shiny nut clam
Ophelia borealis	Bristleworm
Owenia fusiformis	Tubeworm
Pennatula phosphorea	Phosphorescent sea pen
Paradoneis lyra	Paraonid bristle worm

Scientific name	Common name
Paramphinome jeffreysii	Bristle worm
Spiophanes bombyx	Bee spinoid
Sabellaria spinulosa	Ross worm
Spisula subtruncata	Cut trough shell
Virgularia mirabilis	Slender sea pen

J.2 Biotopes

Biotope code	Biotope name
MC121/CR.HCR.FaT	Faunal turf communities on Atlantic circalittoral rock
MD32/SS.SCS	Atlantic offshore circalittoral coarse sediment
MD321/SS.SCS.OCS	Faunal communities in Atlantic offshore circalittoral coarse sediment
MC62/SS.SMu	Atlantic circalittoral mud
MC6212/SS.SMu.CSaMu.ThyEten	*Thyasira* spp. and *Ennucula tenuis* in circalittoral sandy mud
MC6216/SS.SMu.CFiMu.SpnMeg	Sea pens and burrowing megafauna in Atlantic circalittoral fine mud
MD62/SS.SMu	Atlantic offshore circalittoral mud
MD6217/SS.SMu.OMu.LevHet	*Levinsenia gracilis* and *Heteromastus filiformis* in Atlantic offshore circalittoral mud and sandy mud'
MD6218/SS.SMu.OMu.PjefThyAfil	*Paramphinome jeffreysii*, *Thyasira* spp. and *Amphiura filiformis* in Atlantic offshore circalittoral sandy mud
MC42/SS.SMx.CMx	Atlantic circalittoral mixed sediment
MC421/SS.SMx.CMx	Faunal communities of Atlantic circalittoral mixed sediment
MC4213/SS.SMx.CMx.KurThyMx	*Kurtiella bidentata* and *Thyasira* spp. in circalittoral muddy mixed sediment
MD42/SS.SMx	Atlantic offshore circalittoral mixed sediment
MD4211/SS.SMx.OMx.PoVen	Polychaete-rich deep *Venus* community in offshore mixed sediments
MC52/SS.SSa	Atlantic circalittoral sand
MC521/SS.SSa.CFiSa	Faunal communities of Atlantic circalittoral sand
MC5211/SS.SSa.CFiSa.EpusOborApri	*Echinocyamus pusillus*, *Ophelia borealis* and *Abra prismatica* in circalittoral fine sand
MC5212/SS.SSa.CFiSa.ApriBatPo	*Abra prismatica*, *Bathyporeia elegans* and polychaetes in circalittoral fine sand
MD5212/SS.SSa.OSa.OfusAfil	*Owenia fusiformis* and *Amphiura filiformis* in offshore circalittoral sand or muddy sand

Biotope code	Biotope name
MB5236/SS.SSa.IMuSa.FfabMag	*Fabulina fabula* and *Magelona mirabilis* with venerid bivalves and amphipods in infralittoral compacted fine muddy sand
MB5238/SS.SSa.IMuSa.SsubNhom	*Spisula subtruncata* and *Nephtys hombergii* in Atlantic infralittoral muddy sand

J.3 Responses to Natural England Discretionary Advice Service Provided (August, 2026)

Comment	How and where addressed in this technical report and PEIR
Natural England notes that a precautionary 9 km buffer was set based on the maximum spatial extent over which benthic impacts may occur. Natural England notes that sediment dispersion modelling is yet to have been undertaken so the Zone of Influence (ZoI) for the project has yet to be determined.	Sediment plume modelling has been undertaken and is available to view within **Volume 2, Annex 2.2: Model Design Validation and Results**. The modelling indicates that sediment plumes are spatially constrained and transient, with measurable deposition generally limited to within approximately 200 m of the source and SSC increases reducing to background levels within 24 to 48 hours. The results demonstrate that sediment-related effects are largely confined to the immediate vicinity of construction activities. Nevertheless, a precautionary study area extending 9 km from the Offshore Development Area has been adopted for the assessment. Further discussion is provided in **Volume 2, Chapter 3: Benthic Subtidal and Intertidal Ecology, of the PEIR**.
Natural England notes that some baseline data sources more than 10 years old. Whilst these datasets can provide useful contextual information, they should not be relied upon for baseline characterisation or environmental assessments. Natural England refers the Section 12.1: Principles for using existing datasets of our Phase I Offshore Wind Best Practice Advice (Parker et al. 2025a[1]).	The Applicant acknowledges that some data sources included within **Table 3.1** are based on survey data collected more than 10 years ago. The dates of the underlying surveys and datasets and coverage of the Benthic Subtidal and Intertidal Ecology Study Area are presented within **Table 3.1** to provide context and support transparency in the interpretation of the evidence base. These sources were considered alongside more recent site-specific surveys and contemporary datasets as part of a precautionary multiple-lines-of-evidence approach to inform the potential occurrence of benthic habitats and biotopes within the Benthic Subtidal and Intertidal Ecology Study Area and for temporal contextualisation. Greater weight was attributed to MHPGC Project-specific survey data collected within the MHPGC Project PEIR Red Line Boundary, while older datasets were used to supplement the evidence base for the wider ZoI, particularly where they were spatially relevant to the MHPGC Project. Habitats of conservation importance identified within the MHPGC Project PEIR Red Line Boundary have been characterised and ground-truthed using project-specific survey data.
Natural England notes that only 35 of 133 grab samples from 2023 survey were located within the MHPGC Project PEIR Red Line Boundary in 2023, and 42 of 59 stations in 2024. This is understood to be due to the survey covering multiple cable corridor route options. However, Natural England notes that there appears to be large areas without any grab sampling. For example, between KP133 and KP124 (9 km), KP103 and KP94 (11 km), KP94 and KP82 (12 km). Natural England advises that clarification is provided as to why these areas were not surveyed with greater resolution and questions how the benthic communities within these areas will be characterised.	Natural England's comment is noted. The distribution of benthic sampling stations reflects the survey design, which was developed to meet the survey objectives and provide coverage across the alternative offshore export cable route and landfall options under consideration at the time. In 2023, a total of 133 stations were selected as part of a benthic survey strategy desktop study of publicly available data prior to survey acquisition and were spaced at approximately 4 km intervals across the eastern and western route options and associated landfall options (Gardline, 2024a / **Appendix C**). Prior to grab sampling, MBES, magnetometer and side-scan sonar reconnaissance data were reviewed to identify potential archaeological features, unexploded ordnance and other seabed constraints. A subsequent survey in 2024 comprised 59 pre-selected stations focused on the refined export cable route, with stations generally spaced at approximately 2 to 4

Comment	How and where addressed in this technical report and PEIR
	km intervals and adjusted in the field where necessary to avoid seabed hazards and other obstructions (Gardline, 2025a / **Appendix E**). Habitat characterisation was subsequently undertaken using an integrated assessment of sediment sampling, seabed imagery and habitat classification analyses. Biotopes were shown to be relatively homogenous between the locations stated by Natural England (**Figure 4-3**).
Natural England notes some discrepancies between the text within Section 3.3.3 and Table 3-2 regarding the spatial applicability of benthic surveys for the MHPGC Project PEIR Red Line Boundary. Natural England advises that clarification should be provided regarding the spatial overlap of 2023 and 2024 benthic surveys for the Project PEIR Red Line Boundary.	**Section 3.3.3** and **Table 3.2** have been updated to clarify the spatial applicability of the benthic surveys to the MHPGC Project PEIR Red Line Boundary and to distinguish between the number of survey stations located within the boundary and the number of stations where successful grab samples were obtained. Survey stations are shown in **Figure** 3-1.
Natural England notes that DDV surveys were undertaken but only limited information is provided regarding the location and coverage of transects. For example, only grab samples are reported within Figure 3-1. Natural England advises that location, length and coverage of DDV transects is made clearer within the survey report, and that a figure is provided to show the distribution of transects across the survey area. Information should also be provided regarding the sampling strategy for DDV, including whether possible habitats of conservation interest identified by geophysical surveys were targeted for ground-truthing.	**Section 3.3.3** and **Table 3.2** have been updated to provide additional information on the DDV survey methodology, coverage and station selection. DDV was successfully obtained at all sample stations shown in **Figure** 3-1 (this fact has now been detailed within this report), with DDV surveys comprising camera transects typically extending approximately 200 m in total and centred on each survey station. Transects are displayed in full in **Appendix D** and **Appendix F** (see Appendix C of these respective documents). The Applicant notes Natural England's comment regarding the presentation of the DDV survey data. Information on the DDV survey strategy, station locations and transect methodology is provided within the survey documentation (Gardline, 2023; Gardline 2024a,b [**Appendix C** and **Appendix D**]; Gardline 2025a,b [**Appendix E** and **Appendix F**]). Survey stations were pre-selected prior to survey acquisition as part of the survey design process, based on a desktop study of publicly available data. Prior to sampling, geophysical survey data were used to confirm that station locations were suitable for sampling operations.
Natural England notes that the survey report uses surveys from the Cambois Connection export cable corridor project to characterise the regional benthic environment. Whilst Natural England agrees that data from this project may provide useful data for the wider region, the spatial position of this project in relation to the MHPGC Project Boundary is unclear. Whilst 0.25 km is provided as the distance, this is presumably at the closest location and does not represent proximity along the whole cable corridor. In addition, the Cambois Connection landfalls in Northumberland so will not provide useful information for the southern section of the MHPGC Project Boundary. Natural England advises that clarification is provided for the location of the Cambois Connection export cable corridor in relation to the MHPGC Project Boundary to help inform the relevance of provided regional information.	**Table 3.1** has been updated to clarify the spatial relationship between the Cambois Connection export cable corridor and the MHPGC Project PEIR Red Line Boundary by including the location of the Cambois Connection landfall relative to the MHPGC Project landfall. Corresponding clarification has also been included within **Sections 4.3, 4.4, 4.5, 5.2** and **5.3** where the Cambois Connection dataset is discussed in relation to English waters. Reference to Cambois Connection has been removed in relation to intertidal characterisation considering the significant distance from the landfall of the MHPGC Project (**Section 5.3**).

Comment	How and where addressed in this technical report and PEIR
Natural England notes that no areas of Sabellaria spinulosa reef were identified within the survey area, despite being present locally. Natural England questions whether drop-down video transects were located in areas of possible reef, identified by geophysical surveys, to provide confidence that this habitat is not present. Natural England advises that clarification is provided regarding the DDV survey strategy and whether areas of possible S. spinulosa reef were targeted.	The geophysical survey data was not analysed for biogenic reef features ahead of the DDV survey campaign. However, it should be noted that there were 76 DDV samples collected across the MHPGC Project PEIR Red Line Boundary none of which identified of *S. spinulosa* reef. The areas of *S. spinulosa* reef identified by EMODnet (2023) and JNCC (2022) data were also targeted by five DDV samples and no records of reef were recorded. As *S. spinulosa* is an ephemeral feature, its presence will be re-evaluated at the pre-construction phase of the development. However, it has not been recorded within the site-specific survey data collected to date.
Natural England notes that areas of Sea pen and burrowing megafauna were identified by the survey report. Sea pens and burrowing megafauna is a NERC Act (2006) Habitat of Principal Importance and OSPAR listed threatened and/or declining habitat. Natural England advises that the extent of this habitat is quantified and mapped within this region. We also question whether sufficient underwater imagery data has been used, in combination with geophysical survey data, to inform assessments at PEIR stage (and possible micro siting activities during construction, if required).	Natural England's comment is noted. Sea pen and burrowing megafauna communities have been assessed using DDV imagery, sediment sampling and supporting geophysical survey data. Full details of the habitat assessment can be found within Gardline 2024b (**Appendix D**) and Gardline 2024b (**Appendix F**). The distribution of the associated EUNIS biotope MC6216 (Sea pens and burrowing megafauna in Atlantic circalittoral fine mud) is presented in **Figure 4-3** and **Figure 4-4**, based on interpretation of the survey data. Additional text has been included within **Section 4.5** to clarify the distribution of stations exhibiting characteristics of sea pen and burrowing megafauna communities. DDV imagery was acquired at all survey stations and interpreted alongside sediment sampling and available geophysical survey data to support habitat characterisation and ground-truthing. The Applicant therefore considers that sufficient survey data have been collected to inform the PEIR assessment.
Natural England notes that areas of Annex I qualifying stony reef were identified within the survey area, with patches of 'Medium' resemblance reef identified at KP6. Natural England advises that the extent of stony reef is quantified and mapped within this region. We also question whether sufficient underwater imagery data has been used, in combination with geophysical survey data, to sufficiently quantify this habitat and inform assessments at PEIR stage (and possible micrositing activities during construction, if required).	Natural England's comment is noted. Potential stony reef was assessed using DDV imagery, applying the criteria adopted by Irving (2009). Sediment composition and supporting geophysical survey data were used to inform interpretation of the seabed and target investigations of areas with potential stony reef characteristics. To specifically investigate areas of potential stony reef in the nearshore region, three camera-only transects were targeted during the 2024 survey (ENV238, ENV240, and ENV239, with the latter lying within the MHPGC Project PEIR Red Line Boundary). Additional text has been included in **Section 4.5** to clarify the distribution of stations assessed for stony reef resemblance. Of the stations assessed within the MHPGC Project PEIR Red Line Boundary, only ENV188 and ENV219 demonstrated medium resemblance to stony reef, with all other stations showing low or no resemblance. The Applicant considers that the DDV imagery and supporting geophysical data provide an appropriate basis for the assessment of potential stony reef.
Natural England notes discrepancies regarding the occurrence of Annex I qualifying stony reef between the Benthic Ecology Technical Report and the Habitat Assessment Report.	Natural England's comment is noted. The Applicant acknowledges that the text presented within the PEIR focussed on survey stations located within the MHPGC Project PEIR Red Line Boundary and therefore did not fully reflect the wider stony reef resemblance assessment presented in the associated habitat assessment

Comment	How and where addressed in this technical report and PEIR
Natural England advises that clarification is provided regarding the occurrence of stony reef across the survey area.	report. **Section 4.5** has been updated to align with the habitat assessment report and clarify that 17 survey stations were assessed for stony reef resemblance, of which six survey stations showed medium resemblance to stony reef. Two of these stations (ENV188 and ENV219) are located within the MHPGC Project PEIR Red Line Boundary. The assessment was informed by DDV imagery, sediment composition and supporting geophysical survey data.
Natural England notes that IQI scores are reported. However, IQI information is not presented within the Appendices supplied (ref: MHPGC_PEIR_Vol 2_Annex 3.1_Benthic Ecology Technical Report Appendices). Natural England advises that further information on the production of IQI values is presented to provide further evidence.	Following a review of the Benthic Ecology Technical Report and supporting survey documentation, references to Infaunal Quality Index (IQI) scores have been removed from the reporting. No supporting evidence for the reported IQI values could be identified within the available survey reports or appendices, and it is therefore considered that these references were inadvertently carried forward from an earlier draft of the document. The Applicant has amended the report accordingly to ensure consistency between the assessment and the supporting evidence base. The Applicant considers that the benthic baseline characterisation remains robust and adequately supported by the survey data and analyses presented within the report and associated appendices. Consequently, no further information regarding IQI values is available or considered necessary to support the conclusions of the baseline assessment.
Natural England is unclear as to why intertidal surveys at Cambois, Northumberland, are relevant to landfall works in County Durham, 39 km south. Natural England is similarly unclear as to how circalittoral biotopes are relevant to intertidal baseline ecology.	Natural England's comment is noted. As a project-specific intertidal survey had not been undertaken at the time of writing, information from the Cambois Connection project was included solely to provide regional context. To avoid potential confusion regarding the evidence base for the MHPGC Project, references to the Cambois Connection project have been removed from the intertidal ecology baseline (**Section 5**). Site-specific intertidal survey data have been collected across the intertidal study area and will be presented within the technical report submitted in support of the DCO application.
Natural England notes that MPAs designated for benthic habitats have been identified within the ZoI for secondary impacts (e.g. Farnes East MCZ and North East of Farnes Deep HPMA). Natural England advises that modelling may be required to determine the likely impacts upon benthic MPAs within the ZoI for secondary impacts (e.g. sediment deposition modelling).	Sediment plume modelling has been undertaken and is presented **in Volume 2, Annex 2.2: Model Design Validation and Results**. The modelling, together with associated sediment deposition estimates, has been used to define the extent and magnitude of potential sediment-related effects and to inform the assessment of potential impacts on benthic receptors, including the Farnes East MCZ and North East of Farnes Deep HPMA. Modelling scenarios included locations at the closest point to the Farnes East MCZ, representing a precautionary worst-case assessment for potential sediment plume effects on the site. The assessment has considered the predicted overlap of suspended sediment concentration increases and sediment deposition with both the Farnes East MCZ and North East of Farnes Deep HPMA. The results indicate that sediment-related effects would be spatially constrained and largely limited to the vicinity of construction activities. Additional work will be undertaken to assess impacts on the North East of Farnes Deep HPMA,

Comment	How and where addressed in this technical report and PEIR
	as discussed in **Approach to Marine Protected Area/Marine Conservation Zone and Highly Protected Marine Area Assessments, prepared to accompany the PEIR**.
Natural England notes that VERs are included within Table 7-2 and assessment provided as to whether they occur within the MHPGC Project PEIR Red Line Boundary. However, Natural England advises that consideration is provided for habitats and species which are present outside of the boundary, but within the ZoI for the Project – i.e. those habitats which have a potential to be impacted by the project. Natural England advises that Table 7-2 is updated to reflect that habitat and species outside of the Red Line Boundary but within the ZoI have a potential to be impacted by the Project.	The Applicant considers that **Table 7.2** already identifies VERs occurring both within the MHPGC Project PEIR Red Line Boundary and within the wider Benthic Subtidal and Intertidal Ecology Study Area. Within **Table 7.2**, Column 4 ("Distribution within the Benthic Subtidal and Intertidal Ecology Study Area") describes the distribution of each VER across the wider study area, including receptors occurring outside the MHPGC Project PEIR Red Line Boundary but within the potential Zone of Influence. Column 5 ("Within the MHPGC Project PEIR Red Line Boundary?") then indicates whether each VER occurs within the MHPGC Project PEIR Red Line Boundary. The Applicant therefore considers that receptors occurring outside the MHPGC Project PEIR Red Line Boundary, but within the wider study area and potential Zone of Influence, are already captured within **Table 7.2**, and no further amendment is considered necessary.
Natural England notes that Sea pen and burrowing megafauna is also a NERC Act (2006) Habitat of Principal Importance.	Natural England's comment is noted. The Applicant understands Natural England's reference to relate to the association between sea pen and burrowing megafauna communities and the Habitat of Principal Importance (HPI) 'Mud habitats in deep water'. This association has been clarified at the first mention of sea pen and burrowing megafauna communities in English waters within **Section 4.5.2**.
Natural England notes that kelp beds have been identified at Nose's Point but not within the MHPGC Project Red Line Boundary. Natural England notes that no evidence has been provided to demonstrate that kelp beds are not present, noting that they occupy infralittoral waters close to shore and that intertidal survey reports have yet to be provided. In addition, Natural England notes that kelp beds at Nose's Point will remain within the ZoI for the project and have the potential to be affected by secondary impacts. Natural England advises that kelp beds should remain as a VER for further assessment, even if no beds are recorded within the Red Line Boundary.	Natural England's comment is noted. The Applicant acknowledges that kelp beds were not recorded during the project-specific subtidal surveys but are known to occur within the wider study area, including at Nose's Point. Accordingly, kelp beds have been considered as a VER within the wider Benthic Subtidal Ecology Study Area. The outcomes of the project-specific intertidal surveys will be considered during subsequent stages of the assessment, as appropriate. Should evidence of kelp beds be identified within the MHPGC Project PEIR Red Line Boundary, their inclusion as a VER within the Project Red Line Boundary will be reviewed and incorporated into the assessment where warranted.
Natural England advises that Ocean quahog (*Arctica islandica*) is included as a VER as a protected species which is present within the Project Red Line Boundary. Natural England advises that A. islandica is included as a VER within Table 7-2 and that the extent and distribution of this species is characterised.	Natural England's comment is noted. Ocean quahog was mistakenly not included as a VER in English waters and has been added as a VER within **Table 7.2**. Records of ocean quahog identified during the project-specific surveys, including information on its distribution within the MHPGC Project PEIR Red Line Boundary, have also been included within **Section 4.5.2**.
Natural England questions whether peat and clay exposures were identified by the geophysical or benthic ecology surveys.	Natural England's comment is noted. Project-specific geophysical and benthic survey data were reviewed for evidence of peat and clay exposures. No peat exposures were identified during interpretation of the geophysical survey data or

Comment	How and where addressed in this technical report and PEIR
Peat and clay exposures is a NERC Act (2006) Section 41 Habitat of Principal Importance and a Marine Irreplaceable Habitat (Tillin et al. 2022[2]). Natural England advises that the survey report is updated to reflect whether peat and clay exposures were identified across the survey area, and quantified if present.	benthic surveys. In the nearshore section, geophysical interpretation identified areas of rock outcrop and rocky morphology, and noted that some exposed features may represent either bedrock or glacial till. No evidence of piddock borings or piddock communities was recorded during the subtidal benthic surveys. A project-specific intertidal survey has not yet been undertaken and will provide further information on the presence or absence of intertidal peat and clay exposure habitats within the landfall area. Absence of this habitat is now noted within **Section 4.5.2**.
identified as a feature of Teesmouth and Cleveland Coast SPA/Ramsar (UK9006061/UK11068) within the table "Benthic Ecology baseline: designated sites". However, Natural England notes that Saltmarsh is missing from the list of Intertidal VERs. Natural England advises that saltmarsh is included as an intertidal VER if there is potential for impact upon this SPA supporting habitat (i.e. within the Project ZoI).	Natural England's comment is noted. While saltmarsh supports the bird features of the Teesmouth and Cleveland Coast SPA/Ramsar, review of the designated site interest features confirms that saltmarsh is a feature of the Teesmouth and Cleveland Coast SSSI. Although the SSSI overlaps the SPA/Ramsar, the areas of saltmarsh lie further south, outside the Benthic Subtidal Ecology Study Area. The section of the SPA/Ramsar within the Benthic Subtidal Ecology Study Area is associated with the Durham Coast SSSI, which is not designated for saltmarsh. Saltmarsh has therefore been removed from **Table 6.1** to avoid confusion, and additional explanatory text has been included in **Section 5.3.1**. Similarly, reference to saline lagoon has been removed from **Table 6.1**, with supporting justification provided in **Section 5.3.1**.
Natural England notes that 5 VERs are listed as features of the North East of Farnes Deep MCZ / HPMA. Natural England refers to the conservation advice package for the site which describes that the whole ecosystem is protected, defined as: "all marine flora and fauna, all marine habitats and all geological or geomorphological interests, including all abiotic elements and all supporting ecosystem functions and processes, in or on the sea bed, water column and the surface of the sea." See: Conservation Advice for North East of Farnes Deep HPMA. Natural England advises that the VERs for North East of Farnes Deep MCZ/HPMA should reflect the designated feature for the site.	Natural England's comment is noted. The Applicant acknowledges that the designated feature of the North East of Farnes Deep HPMA is the marine ecosystem of the area, encompassing all marine flora and fauna, marine habitats, geological and geomorphological interests, associated abiotic elements, and supporting ecosystem functions and processes. The five features presented in the Benthic Ecology assessment relate to the North East of Farnes Deep MCZ and are not intended to represent the designated feature of the HPMA. Identification of the relevant ecosystem components and receptors for the North East of Farnes Deep HPMA will be undertaken as part of the dedicated HPMA assessment, which will adopt a whole-ecosystem approach consistent with the site's conservation advice. Additional work will be undertaken to assess impacts on the North East of Farnes Deep HPMA, as discussed in the **Approach to Marine Protected Area/Marine Conservation Zone and Highly Protected Marine Area Assessments, prepared to accompany the PEIR.**
Natural England notes that the Appendices are provided combined into a very large document without any index or navigational information. Natural England requests that future documents for review include an index for navigation to enable review.	Natural England's comment is noted. The Applicant will ensure an index is provided for the Appendices.
